Simplified Document Sharing and Accessibility With Acquia Drupal-Site-Builder PDF (Questions)

For candidates who are looking for Drupal-Site-Builder exam braindumps, they pay much attention to the quality. With experienced experts to compile and verify, Drupal-Site-Builder exam materials are high quality, and you can pass your exam and get the corresponding certification successfully. In addition, we recommend you to try free demo for Drupal-Site-Builder Exam Dumps before purchasing, so that you can know what the complete version is like. We have online and offline service. If you have any questions for Drupal-Site-Builder exam materials, you can consult us, and we will give you reply as quickly as we can.

Acquia Certified Drupal Site Builder Exam for Drupal 10, 11 Sample Questions (Q41-Q46):

NEW QUESTION # 41

While building a new site, you are working with the default frontend theme. You have placed custom blocks in available regions. After some time, you decide to install a new contributed theme, and set it as the default for the site. After switching to the new theme, you notice that many of your blocks have disappeared! What is the likely reason for this?

- A. The new theme only allows system blocks, not custom blocks.
- B. The blocks were built in such a way that they are not compatible with the new theme. They need to be re-created.
- C. The blocks have not yet been registered with the new theme.
- **D. The new theme's regions have different names from the regions in the old theme. Those blocks have been disabled.**

Answer: D

Explanation:

In Drupal 10 and Drupal 11, block placement is defined per theme. The Block Layout documentation explains that when placing a block, you are assigning it to a region in a specific theme, not globally for all themes. So when you switch the site's default theme,

the new theme may have a different set of regions or different region names, and block placements from the previous theme may no longer map correctly.

Drupal's theming documentation is even more explicit: if a theme does not define a region that blocks were assigned to, those blocks are treated as assigned to an invalid region and are disabled . The Block module documentation also states that disabled blocks (blocks not assigned to any region in your theme) are never shown . This is exactly why blocks can appear to "disappear" after changing themes.

The other options do not match Drupal's documented behavior. Blocks do not need to be "registered" with a theme in this sense, contributed themes are not limited to system blocks, and custom blocks generally do not need to be recreated just because the theme changed. The issue is the theme-specific region mapping , which makes D the correct answer.

NEW QUESTION # 42

You are building a Drupal site for a company which has two content types, Page and Article. The layout of the content region on both the content types needs to be different. Page content type needs to have a three- column layout for the content section whereas the Article content type needs to use a two-column layout.

How will you build this functionality assuming all the core modules on the site are enabled?

- A. For each content type, enable "Use Layout Builder" in layout options on the Manage display tab and select appropriate two-column / three-column layouts for the content types.
- B. For each content type, enable "Use Layout Builder" in layout options on the Manage display tab and also check the "Allow each content item to have its layout customized" option.
- C. While defining the content types, select the two-column layout or three-column layout as appropriate while adding the fields.
- D. Add field groups named two-column and three-column in respective content types and organize fields in the field groups. Add appropriate layout styles in your theme.

Answer: A

Explanation:

The correct answer is D . Drupal core's Layout Builder is specifically designed to let site builders create different display layouts for different bundles, including content types such as Page and Article . The official Layout Builder documentation explains that it can be used to create layouts for content types and other entity types, and that layout defaults apply to all items of a given bundle. That matches this scenario exactly: one content type needs a default three-column layout and another needs a default two-column layout. Option B is not the best answer because the extra setting "Allow each content item to have its layout customized" enables layout overrides for individual nodes. The question asks for different layouts by content type , not per individual content item, so overrides are unnecessary. Drupal documentation states that layout overrides are optional and are only needed when each entity may differ from the bundle default.

Option A is incorrect because field grouping and theme styling are not the Drupal core mechanism for bundle- level visual page layouts. Option C is also incorrect because content types are not assigned page layouts during field creation. In Drupal core, this is handled later through Manage display with Layout Builder enabled for each content type.

NEW QUESTION # 43

You have created a custom block "Festival Offer" and placed this block in the header section of your site.

Your site has a "Premium customer" user role. You need to show this block only on the front page and only to users who have a "Premium customer" user role.

Which two visibility settings you need to make to the "Festival Offer" block to achieve these requirements?

- A. Select the user role "Authenticated user" from the Roles tab.
- B. Remove < front > path in the Pages tab & select "Hide for the listed pages".
- C. Add < front > path in the Pages tab and select "Show for the listed pages".
- D. Select the user role "Premium customer" from the Roles tab.

Answer: C,D

Explanation:

Drupal 10 and Drupal 11 let you control block display through visibility conditions on the block configuration form. Drupal's block management documentation explains that a block's visibility can depend on page- specific visibility settings and also on user role conditions. For page visibility, Drupal specifically notes that the front page is an exception and must be entered as < front > . To show a block only on the homepage, you add < front > in the Pages visibility settings and choose "Show for the listed pages." To limit the block to a specific audience, you use the Roles visibility condition and select the exact role that should see the block. In this

case, that is Premium customer , not the broader Authenticated user role, because selecting Authenticated user would show the block to all logged-in users who have that role, not just premium customers. Drupal core's block form API also confirms that block visibility is built through configurable visibility conditions in the block UI.

So the correct combination is:

A for the role restriction, and B for the front-page-only restriction.

NEW QUESTION # 44

A new customer has asked, why a Drupal-based website will be more flexible over a custom developed website. Which THREE Drupal features would you explain to the customer?

- A. Drupal provides comprehensive content modeling and listing of content using UI.
- B. Drupal can be used as a headless CMS out of the box.
- C. Drupal has a comprehensive and feature rich administrative UI out of the box.
- D. Drupal.org has an online store where you can purchase modules and themes.
- E. Drupal allows you to directly rename database columns from the UI.

Answer: A,B,C

Explanation:

Drupal 10 and Drupal 11 are flexible because they provide major site-building capabilities through configuration and core modules, instead of requiring everything to be custom-coded. Drupal supports headless

/decoupled use cases out of the box through core web services such as JSON:API , which Drupal documentation describes as a standard way to expose site content for decoupled applications. That makes A correct.

Drupal also provides strong content modeling through entity types and fields, and it supports listing and displaying content through the Views UI . The User Guide and core documentation explain that site builders can define structured content types and then create listings, pages, blocks, sorting, and filtering through Views without writing custom code. That makes B correct.

Drupal additionally ships with a rich administrative interface for installing modules, managing themes, creating content types, editing fields, configuring permissions, and administering content. This is one of the platform's core strengths compared with a purely custom-built system, so E is correct.

Options C and D are not correct. Drupal.org provides contributed projects, but not an online store for buying modules and themes, and Drupal does not present direct database-column renaming as a normal UI-based site- building feature.

NEW QUESTION # 45

Your Main navigation menu has two levels of menu items like sections, and child pages within each section.

Your UX team wants to make it easier for a site visitor viewing a child page to see what other pages are in that section. They have asked you to add a submenu to the Sidebar region on child pages.

How can you add a submenu to the child pages that shows all child pages in the section?

- A. Add the Main navigation menu to the Sidebar region, and use CSS to hide the top level menu items.
- B. Create a new menu for each main section containing links for each child page, and add each menu's block to the Sidebar region.
- C. In Block layout, place the Main navigation block in the Sidebar region. Set the initial visibility level to 1.
- D. In Block layout, place the Main navigation block in the Sidebar region. Set the initial visibility level to 2.

Answer: D

Explanation:

In Drupal 10 and Drupal 11, menus can be displayed as blocks and configured to show specific levels of the menu hierarchy. The "Main navigation" block includes settings such as "Starting level" (or initial visibility level) and "Maximum number of levels to display." These settings allow site builders to control which part of the menu tree is visible in a given region.

To display only the child pages (submenu items) when a user is on a child page, you need to configure the block to start displaying from level 2 , which corresponds to the submenu under the current top-level section.

This ensures that only relevant sibling pages within the same section are shown in the sidebar, improving usability and navigation.

Option B (level 1) would still show top-level menu items, not just the submenu. Option A is not recommended because using CSS to hide elements does not follow Drupal's configuration best practices.

Option D is unnecessary and inefficient, as Drupal's menu system already supports hierarchical display without creating duplicate menus.

Thus, configuring the menu block with an initial visibility level of 2 is the correct and recommended approach.

NEW QUESTION # 46

.....

If you are preparing for the Acquia Certified Drupal Site Builder Exam for Drupal 10, 11 (Drupal-Site-Builder) exam dumps our Drupal-Site-Builder Questions help you to get high scores in your Acquia Certified Drupal Site Builder Exam for Drupal 10, 11 (Drupal-Site-Builder) exam. Test your knowledge of the Acquia Certified Drupal Site Builder Exam for Drupal 10, 11 (Drupal-Site-Builder) exam dumps with ExamcollectionPass Acquia Certified Drupal Site Builder Exam for Drupal 10, 11 (Drupal-Site-Builder) practice questions. The software is designed to help with Acquia Certified Drupal Site Builder Exam for Drupal 10, 11 (Drupal-Site-Builder) exam dumps preparation. Acquia Certified Drupal Site Builder Exam for Drupal 10, 11 (Drupal-Site-Builder) practice test software can be used on devices that range from mobile devices to desktop computers.
