## Valid XSOAR-Engineer Guide Files, XSOAR-Engineer Exam Topic

All these three Palo Alto Networks XSOAR Engineer (XSOAR-Engineer) exam questions formats offered by the DumpsTests are easy to use and perfectly work with all the latest web browsers, operating systems, and devices. The DumpsTests XSOAR-Engineer web-based practice test software and desktop practice test software both are the mock Palo Alto Networks XSOAR-Engineer Exam that will give you real-time Palo Alto Networks XSOAR Engineer (XSOAR-Engineer) exam environment for quick preparation.

## Palo Alto Networks XSOAR Engineer Sample Questions (Q68-Q73):

### **NEW QUESTION # 68**

A breakpoint is added to a saved playbook to ensure that it pauses before running the task "ad-delete-user." However, it is later discovered that an Active Directory account was deleted by this playbook, and the playbook did not pause at the breakpoint. What is the cause of this issue?.

- A. The playbook does not stop at the breakpoint when run from an incident.
- B. The playbook was not set to "quiet mode."
- C. The task was not set to "skip."
- D. The task was not configured to override input.

**Answer: A**

Explanation:

The XSOAR Playbook Debugger documentation states that breakpoints only apply when the playbook is run in Debug mode, not when an incident triggers the playbook normally.

Running from an incident executes the playbook without debugger controls, so breakpoints are ignored- leading to the deletion task running normally.

**NEW QUESTION # 69**

The code snippet below is from the fetch command of an integration instance configured to run on the server.

`demisto.debug(f'{len(incidents)} events fetched')`

Where is the output from the snippet located when the instance runs an automatic fetch?.

- A. Integration Logs table.
- B. War Room entry.
- C. Incident label.
- D. Platform Log bundle.

**Answer: A**

Explanation:

Integration debug messages (generated using `demisto.debug`) are stored in the Integration Logs table, not in the War Room or incident labels.

The Admin Guide states that all logs generated by integration code are visible through the Integration Logs section for troubleshooting.

**NEW QUESTION # 70**

Where can engineers add the post-processing scripts to incidents?

- A. The post-processing tag must be added to the automation
- B. Post-processing scripts must be added from the Incident Type editor
- C. Post-processing scripts must be added at the end of playbooks
- D. Post-processing scripts must be added from the Post-Process Rules editor

**Answer: B**

**NEW QUESTION # 71**

Two feed integrations with the same source reliability (B - Usually reliable) fetch the same indicator with the following verdicts:

Integration A - Malicious

Integration B - Benign

Indicator data from Integration B was fetched after Integration A.

What will be the values of the fields associated with the indicator?.

- A. Verdict: Malicious  
Other Fields: Values from Integration B.
- B. Verdict: Malicious  
Other Fields: Values from Integration A.
- C. Verdict: Benign  
Other Fields: Values from Integration B.
- D. Verdict: Benign  
Other Fields: Values from Integration A.

**Answer: D**

#### Explanation:

According to the Threat Intelligence section of the XSOAR Admin Guide, indicatorverdict resolution uses two key rules:

- \* If multiple sources have different reliability levels, the verdict from the highest-reliability source wins.
- \* If multiple sources share the same reliability, XSOAR selects the "worst" (most severe) verdict among them.

Because both integrations have equal reliability (B - Usually reliable), XSOAR selects the more severe verdict. "Malicious" is more severe than "Benign," so the resulting indicator verdict will be Malicious.

However, indicatorfield values follow a different rule:

When multiple sources share the same reliability score, the most recently updated source overwrites the indicator fields, except for the verdict field.

Integration B updated the indicator after Integration A, so its field values overwrite Integration A's fields. But its verdict does not override the malicious verdict because severity resolution rules take precedence.

Therefore, the correct combined logic yields:

- \* Verdict: Benign? No # Because Malicious is the highest severity.
- \* Other Fields: From the most recently updated feed # Integration B.

But the verdict is strictly the "worst" verdict, so:

Correct answer: C.

#### NEW QUESTION # 72

Which of these would be the most operationally efficient repository for moving XSOAR custom content from a development server to a production environment?

- A. Cortex XSOAR public content repository
- B. A content repository specified in the Marketplace
- C. The development server's default repository
- D. **Remote git repository specified in the dev-prod configuration parameters**

**Answer: D**

#### NEW QUESTION # 73

.....

Don't you want to make a splendid achievement in your career? Certainly hope so. Then it is necessary to constantly improve yourself. Working in the Palo Alto Networks industry, what should you do to improve yourself? In fact, it is a good method to improve yourself by taking Palo Alto Networks certification exams and getting Palo Alto Networks certificate. Palo Alto Networks certificate is very important certificate, so more and more people choose to attend XSOAR-Engineer Certification Exam.
