질문 # 17

How does a firewall behave when SSL Inbound Inspection is enabled?

- A. It decrypts inbound and outbound SSH connections.
- B. It decrypts traffic between the client and the external server.
- C. It acts transparently between the client and the internal server.
- **D. It acts as meddler-in-the-middle between the client and the internal server.**

정답: D

설명:

SSL Inbound Inspection allows the firewall to decrypt incoming encrypted traffic to internal servers (e.g., web servers) by acting as a man-in-the-middle (MITM). The firewall uses the private key of the server to decrypt the session and apply security policies before re-encrypting the traffic.

SSL Inbound Inspection requires you to import the server's private key and certificate into the firewall. The firewall then acts as a man-in-the-middle (MITM) to decrypt inbound sessions from external clients to internal servers for inspection.
