NREMT EMT Latest Dump, EMT Questions Answers

In order to adapt to different level differences in users, the EMT exam questions at the time of writing teaching materials with a special focus on the text information expression, as little as possible the use of crude esoteric jargon, as much as possible by everyone can understand popular words to express some seem esoteric knowledge, so that more users through the EMT Prep Guide to know that the main content of qualification examination, stimulate the learning enthusiasm of the user, arouse their interest in

learning.

NREMT Emergency Medical Technicians Exam Sample Questions (Q89-Q94):

NEW QUESTION # 89

A 16-year-old patient has suicidal ideations. How should the EMT proceed?

- A. Contact law enforcement.
- B. Restrain the patient for their safety.
- C. Avoid performing a physical assessment.
- **D. Ask if there is a plan to hurt themselves.**

Answer: D

Explanation:

The best next step is to ask directly whether the patient has a plan to hurt themselves. In behavioral emergency care, EMTs are taught not to ignore suicidal statements and not to be vague about them. A direct question about plan and intent helps determine the immediacy of the danger and guides safe management and transport decisions. National suicide-prevention guidance also recommends asking whether the person is thinking about killing themselves as a core first action. (National Institute of Mental Health) In plain EMT terms: a teenager saying they have suicidal thoughts is a patient who needs a calm, focused assessment of risk, and asking about a specific plan is part of that assessment. (PMC)

NEW QUESTION # 90

A 24-year-old male was injured in an explosion at a large factory. He is breathing shallowly at a rate of 40 and his capillary refill is 3 seconds. What color should you assign him for triage?

- A. Yellow
- B. Black
- C. Green
- **D. Red**

Answer: D

Explanation:

Using the START triage system, patients are categorized based on Respirations, Perfusion, and Mental Status (RPM). A respiratory rate greater than 30 breaths per minute immediately qualifies the patient as RED (Immediate). Additionally, delayed capillary refill (>2 seconds) further supports this classification. Option A is correct. Option B applies to stable patients who can wait. Option C is for deceased or nonsalvageable patients. Option D is for minor injuries. NREMT teaches that patients with compromised airway or perfusion are the highest priority.

NEW QUESTION # 91

Which of the following findings are consistent with congestive heart failure? Select the two answer options that are correct.

- A. Ascites
- B. Chest pain
- C. Wheezing
- **D. Crackles**
- **E. Dependent edema**

Answer: D,E

Explanation:

The correct answers are B. Crackles and E. Dependent edema.

Why B is correct (Crackles):

Crackles (rales) are a hallmark sign of pulmonary edema, which occurs in left-sided heart failure.

- * Fluid accumulates in the alveoli
- * Causes crackling sounds on auscultation
- * Indicates impaired cardiac pumping ability

NREMT-aligned guidance states:

- * "Pulmonary edema presents with crackles due to fluid in the lungs."

Why E is correct (Dependent edema):

Dependent edema is a classic sign of right-sided heart failure.

- * Fluid backs up into systemic circulation
- * Leads to swelling in:
 - * Legs
 - * Ankles
 - * Lower extremities

NREMT-aligned guidance:

- * "Right-sided heart failure results in peripheral or dependent edema." Why the other options are incorrect:

* A. Ascites: Can occur in severe right-sided failure but is less common and not a primary EMT-level finding.

* C. Wheezing: More commonly associated with asthma or bronchospasm (though CHF can cause

"cardiac wheezing," it is not the best answer here).

* D. Chest pain: Suggests cardiac ischemia, not specifically CHF.

Exact Extracts:

* "Left-sided heart failure leads to pulmonary edema and crackles."

* "Right-sided heart failure causes dependent edema."

* "Fluid accumulation results from the heart's inability to pump effectively." References:

NEW QUESTION # 92

An 8-year-old female is drooling, incontinent, and her eyes are watery. Her father tells you that she was playing in the garden. You should suspect

- A. anthrax.
- B. a bee sting.
- C. organophosphate poisoning.
- D. an anticholinergic reaction.

Answer: C

Explanation:

This question is pointing you toward recognizing a toxidrome, specifically the cholinergic toxidrome. The key symptoms here—drooling, watery eyes (lacrimation), and incontinence—are classic findings associated with organophosphate exposure, which is commonly found in pesticides used in gardens.

A helpful EMT memory aid is "SLUDGE" (Salivation, Lacrimation, Urination, Defecation, Gastrointestinal upset, Emesis). This patient already shows multiple SLUDGE signs, which strongly indicates organophosphate poisoning.

So when you see a patient with excessive secretions + exposure to a garden/chemicals, the correct suspicion is organophosphate poisoning.

NEW QUESTION # 93

A 3-year-old patient ingested laundry detergent. The patient is drowsy and has crackles in all lung fields.

What should most concern the EMT at this time? Select the three answer options that are correct.

- A. Respiratory failure
- B. Esophageal perforation
- C. Acid reflux
- D. Seizure
- E. Hypoglycemia
- F. Vomiting

Answer: A,B,F

Explanation:

Laundry detergent ingestion - especially in the case of liquid detergent pods - is associated with caustic airway and gastrointestinal injuries. The presence of crackles and drowsiness are signs of aspiration and possible respiratory failure. Vomiting increases the risk of aspiration pneumonitis, and esophageal perforation is a life-threatening complication from corrosive ingestion.

While seizure and hypoglycemia are possible complications of toxic ingestion, they are not as immediately linked to the detergent profile as airway injury and aspiration risk.
