Snowflake Certified SnowPro Associate - Platform Certification Sample Questions (Q147-Q152):

NEW QUESTION # 147

You are using Snowflake notebooks to build a data pipeline. You want to parameterize a SQL query using Python variables to filter data based on a date range provided as input to the notebook. You have and 'end_date' Python variables. Which of the following is the most secure and efficient way to incorporate these variables into a SQL query executed within a Snowflake notebook using Snowpark?

- A.

```
session.sql("SELECT FROM my_table WHERE date_column BETWEEN ? AND ?", params=[start_date, end_date]).collect()
```
- B.

```
session.sql("SELECT FROM my_table WHERE date_column BETWEEN :1 AND :2", start_date, end_date).collect()
```
- C.

```
session.sql("SELECT FROM my_table WHERE date_column BETWEEN " + start_date + " AND " + end_date).collect()
```
- D.

```
session.sql(f"SELECT FROM my_table WHERE date_column BETWEEN '{start_date}' AND '{end_date}'").collect()
```
- E.

```
session.sql("SELECT FROM my_table WHERE date_column BETWEEN " + start_date + " AND " + end_date).collect()
```

Answer: B

Explanation:

Option B is the most secure and efficient way. Snowpark's 'session.sql()' method supports parameterized queries using ':1', ':2', etc., to represent placeholders for the Python variables.

This prevents SQL injection vulnerabilities and allows Snowflake to optimize the query execution plan by reusing it with different parameter values. Option A is vulnerable to SQL injection. Option C is a less secure string formatting method. Option D is prone to errors and SQL injection. Option E is not a valid way to parameterize the query in Snowflake with Snowpark API.

NEW QUESTION # 148

What information can users view in the Query History option in Snowsight?

- A. Data storage configuration
- B. Only successful queries
- C. Details of executed queries, including status, duration, and resource usage
- D. Network settings

Answer: C

Explanation:

Snowsight's Query History interface provides comprehensive visibility into executed queries. Users can view:

- * Query text
- * Execution status (running, succeeded, failed)
- * Duration and start/end timestamps
- * Warehouse used and credits consumed
- * Partition pruning details
- * Error messages
- * Query profile for performance diagnostics

This allows developers, analysts, and administrators to troubleshoot slow queries, identify bottlenecks, and monitor compute usage.

Incorrect options:

- * Query History shows failed and running queries, not just successful ones.
- * Storage configuration is unrelated to query operations.
- * Network settings are managed by the Cloud Services Layer, not Query History.

Thus, Query History is a key operational tool in Snowsight.

NEW QUESTION # 149

You are responsible for optimizing data loading into Snowflake from a large set of CSV files stored in Azure Blob Storage. The files contain millions of records and are updated daily. You need to choose the MOST efficient method for loading this data, considering both performance and cost. Select TWO options that would best address this scenario.

- A. Utilize Snowflake's Data Marketplace to subscribe to a pre-built data feed containing similar data.
- B. Use the Snowflake web UI to manually upload the CSV files on a daily basis.
- C. Implement Snowpipe with a notification integration that triggers data loading only when new files are added to the Azure Blob Storage container, using a medium virtual warehouse.
- D. Use a scheduled task that executes a COPY INTO statement with a large virtual warehouse (e.g., LARGE) at the end of each day.
- E. Use Snowpipe with auto-ingest enabled and a dedicated X-SMALL virtual warehouse.

Answer: C,E

Explanation:

Snowpipe with auto-ingest (A) provides continuous data loading as soon as new files are available in the stage, making it highly efficient for near real-time ingestion. It leverages serverless compute for loading, optimizing cost. Coupling it with a notification integration (D) makes the process even more event-driven and efficient, ensuring that data loading is triggered immediately upon file arrival. Option B is a batch process using scheduled tasks which is not ideal, and the other two aren't related to the data loading process that the question is asking.

NEW QUESTION # 150

What is Snowflake Data Exchange used for?

- A. Managing user permissions
- B. Storing raw data
- C. Sharing data between specific Snowflake accounts
- D. Sharing data with all Snowflake accounts

Answer: C

Explanation:

Snowflake Data Exchange enables secure, governed sharing of live data between Snowflake accounts. It lets providers publish datasets to specific consumers—partners, vendors, departments, or customers—without copying or transferring data. Consumers query shared data instantly, leveraging Snowflake's secure data sharing architecture.

Key capabilities include:

- * Targeted sharing to selected accounts
- * Fine-grained access management and auditing
- * Live, real-time data sharing without data movement
- * Ability to customize listings and visibility

Data Exchange is different from the Marketplace, which supports public or broad distribution.

It does not store raw data—storage occurs in provider accounts.

It does not manage user permissions (that is the role of RBAC).

NEW QUESTION # 151

You are tasked with loading data from an external stage containing gzipped CSV files into a Snowflake table. The CSV files have a header row that you want to skip during the load process.

Additionally, you need to transform the data during the load, specifically concatenating two columns (FIRST NAME and LAST NAME) into a new column called FULL NAME. Which combination of the following COPY INTO options will accomplish this task? Choose all that apply.

- A. FILE_FORMAT = (TYPE = CSV, SKIP_HEADER = 1, COMPRESSION = 'GZIP')
- B. TRANSFORM AS SELECT \$1, \$2, \$3 || \$4 FROM @mystage/data.csv
- C. FILE_FORMAT = (TYPE = CSV, SKIP_HEADER = 1, COMPRESSION = 'GZIP'), TRANSFORM AS SELECT \$1, \$2, \$3 || \$4 FROM @mystage/data.csv
- D. TRANSFORM = (FULL_NAME = FIRST_NAME || ' ' || LAST_NAME)
- E. ON_ERROR = 'SKIP FILE'

Answer: A,B

Explanation:

Option A sets the FILE FORMAT correctly specifying the file type as CSV, skipping the header row (SKIP HEADER = 1), and specifying the compression type as GZIP. Option D correctly transforms the data by selecting all columns and concatenating the columns. This option assumes the file format is already defined in the COPY INTO statement. The @mystage/data.csv after FROM should only include name of the stage name and not the filename. However, that is not part of copy options but part of FROM Statement. The TRANSFORMS parameters that are part of copy options are deprecated.
