[2026] GitHub GitHub-Advanced-Security Questions: Fosters Your Exam Passing Abilities

The GitHub Advanced Security GHAS Exam (GitHub-Advanced-Security) study material of PDFBraindumps is available in three different and easy-to-access formats. The first one is printable and portable GitHub Advanced Security GHAS Exam (GitHub-Advanced-Security) PDF format. With the PDF version, you can access the collection of actual GitHub Advanced Security GHAS Exam (GitHub-Advanced-Security) questions with your smart devices like smartphones, tablets, and laptops. You can even print the study material and save it in your smart devices to study anywhere and pass the GitHub Advanced Security GHAS Exam (GitHub-Advanced-Security) certification exam.

GitHub Advanced Security GHAS Exam Sample Questions (Q37-Q42):

NEW QUESTION # 37

As a developer with write access, you navigate to a code scanning alert in your repository. When will GitHub close this alert?

- A. After you triage the pull request containing the alert
- B. When you use data-flow analysis to find potential security issues in code
- C. After you find the code and click the alert within the pull request
- D. After you fix the code by committing within the pull request

Answer: D

Explanation:

GitHub automatically closes a code scanning alert when the vulnerable code is fixed in the same branch where the alert was generated, usually via a commit inside a pull request. Simply clicking or triaging an alert does not resolve it. The alert is re-evaluated after each push to the branch, and if the issue no longer exists, it is marked as resolved.

NEW QUESTION # 38

In the pull request, how can developers avoid adding new dependencies with known vulnerabilities?

- A. Add a workflow with the dependency review action.
- B. Add Dependabot rules.
- C. Enable Dependabot alerts.
- D. Enable Dependabot security updates.

Answer: A

Explanation:

To detect and block vulnerable dependencies before merge, developers should use the Dependency Review GitHub Action in their pull request workflows. It scans all proposed dependency changes and flags any packages with known vulnerabilities.

This is a preventative measure during development, unlike Dependabot, which reacts after the fact.

NEW QUESTION # 39

Which of the following Watch settings could you use to get Dependabot alert notifications? (Each answer presents part of the solution. Choose two.)

- A. The Ignore setting
- B. The Participating and @mentions setting
- C. The Custom setting
- D. The All Activity setting

Answer: C,D

Explanation:

Comprehensive and Detailed Explanation:

To receive Dependabot alert notifications for a repository, you can utilize the following Watch settings:

Custom setting: Allows you to tailor your notifications, enabling you to subscribe specifically to security alerts, including those from Dependabot.

All Activity setting: Subscribes you to all notifications for the repository, encompassing issues, pull requests, and security alerts like those from Dependabot.

The Participating and @mentions setting limits notifications to conversations you're directly involved in or mentioned, which may not include security alerts. The Ignore setting unsubscribes you from all notifications, including critical security alerts.

NEW QUESTION # 40

When using CodeQL, what extension stores query suite definitions?

- A. .yml
- B. .qll
- C. .ql
- D. .qls

Answer: D

Explanation:

Query suite definitions in CodeQL are stored using the .qls file extension. A query suite defines a collection of queries to be run during an analysis and allows for grouping them based on categories like language, security relevance, or custom filters.

In contrast:

- * .ql files are individual queries.
- * .qll files are libraries used by .ql queries.
- * .yml is used for workflows, not query suites.

NEW QUESTION # 41

Assuming that no custom Dependabot behavior is configured, who has the ability to merge a pull request created via Dependabot security updates?

- A. A repository member of an enterprise organization
- **B. A user who has write access to the repository**
- C. An enterprise administrator
- D. A user who has read access to the repository

Answer: B

Explanation:

Comprehensive and Detailed Explanation:

By default, users with write access to a repository have the ability to merge pull requests, including those created by Dependabot for security updates. This access level allows contributors to manage and integrate changes, ensuring that vulnerabilities are addressed promptly.

Users with only read access cannot merge pull requests, and enterprise administrators do not automatically have merge rights unless they have write or higher permissions on the specific repository.

NEW QUESTION # 42

.....

With GitHub-Advanced-Security study tool, you are not like the students who use other materials. As long as the syllabus has changed, they need to repurchase learning materials. This not only wastes a lot of money, but also wastes a lot of time. Our industry experts are constantly adding new content to GitHub-Advanced-Security Exam Torrent based on constantly changing syllabus and industry development breakthroughs. We also hire dedicated staff to continuously update our question bank daily, so no matter when you buy GitHub-Advanced-Security guide torrent, what you learn is the most advanced.
