

Salesforce Integration-Architect Valid Test Tutorial: Salesforce Certified Integration Architect & Certification Success Guaranteed, Easy Way of Training

What's more, part of that ValidTorrent Integration-Architect dumps now are free: <https://drive.google.com/open?id=1fFhd7AbgL4MPpje0MAxTpnS8LjcKs7PG>

We abandon all obsolete questions in this latest Integration-Architect exam torrent and compile only what matters toward actual real exam. The downloading process is operational. It means you can obtain Integration-Architect quiz torrent within 10 minutes if you make up your mind. Do not be edgy about the exam anymore, because those are latest Integration-Architect Exam Torrent with efficiency and accuracy. You will not need to struggle with the exam. Besides, there is no difficult sophistication about the procedures, our latest Integration-Architect exam torrent materials have been in preference to other practice materials and can be obtained immediately.

Keep making progress is a very good thing for all people. If you try your best to improve yourself continuously, you will that you will harvest a lot, including money, happiness and a good job and so on. The Integration-Architect preparation exam from our company will help you keep making progress. Choosing our Integration-Architect Study Material, you will find that it will be very easy for you to overcome your shortcomings and become a persistent person. Just come and buy our Integration-Architect learning guide!

Pass Guaranteed 2026 Integration-Architect: Useful Salesforce Certified Integration Architect Valid Test Tutorial

ValidTorrent customizable practice exams (desktop and web-based) help students know and overcome their mistakes. The customizable Salesforce Integration-Architect practice test means that the users can set the Salesforce Certified Integration Architect (Integration-Architect) Dumps and time according to their needs so that they can feel the real-based Integration-Architect exam scenario and learn to handle the pressure.

To prepare for the Salesforce Integration-Architect Exam, candidates must have experience working with Salesforce and implementing integration solutions. They should also have a solid understanding of integration patterns, protocols, and tools. Salesforce offers a range of training resources, including courses, guides, and practice exams, to help candidates prepare for the

exam. Additionally, Salesforce recommends that candidates gain hands-on experience by working on real-world integration projects.

Salesforce Certified Integration Architect Sample Questions (Q128-Q133):

NEW QUESTION # 128

A company has an external system that processes and tracks orders. Sales reps manage their leads and opportunity pipeline in Salesforce. In the current state, the two systems are disconnected and processing orders requires a lot of manual entry on sales rep part. This creates delays in processing orders and incomplete data due to manual entry.

As a part of modernization efforts, the company decided to integrate Salesforce and the order management system. The following technical requirements were identified:

1. Orders need to be created in real time from salesforce
2. Minimal customization*, and code should be written due to a tight timeline and lack of developer resources
3. Sales reps need to be able to see order history and be able to see most up to date information on current order status.
4. Managers need to be able to run reports in Salesforce to see daily and monthly order volumes and fulfillment timelines.
5. The legacy system is hosted on premise and is currently connected to the Enterprise Service Bus (ESB). The ESB is flexible enough to provide any methods and connection types needed by salesforce team.
6. There are 1000 sales reps. Each user processes/creates on average 15 orders per shift. Most of the orders contain 20-30-line items.

How should an integration architect integrate the two systems based on the technical requirements and system constraints?

- A. Use Salesforce big object, SOAP API and Dataloader.
- B. Use Salesforce external object and OData connector.
- C. Use Salesforce standard object, REST API and ETL.
- **D. Use Salesforce custom object, custom REST API and ETL.**

Answer: D

Explanation:

Explanation

Using Salesforce custom object, custom REST API and ETL is a better solution than using Salesforce standard object, REST API and ETL. A custom object can store the order information and provide more flexibility and control over the data model, validation rules, triggers, etc. A custom REST API can be used to create orders in real time from Salesforce, using the ESB as a proxy to communicate with the legacy system. An ETL tool can be used to sync the order history and status from the legacy system to Salesforce, using the last modified date as a filter. This way, sales reps can see the order history and the most up-to-date information on current order status, and managers can run reports on order volumes and fulfillment timelines. A standard object, such as Order, may not meet all the business requirements and may require more customization than a custom object.

A standard REST API may not provide enough security and error handling for creating orders in real time.

NEW QUESTION # 129

Which WSDL should an architect consider when creating an integration that might be used for more than one salesforce organization and different metadata?

- A. SOAP API WSDL
- B. Corporate WSDL
- C. Enterprise WSDL
- **D. Partner WSDL**

Answer: D

Explanation:

Explanation

The Partner WSDL is the best option for creating an integration that might be used for more than one Salesforce organization and different metadata. The Partner WSDL is loosely typed and can reflect against any configuration of Salesforce. It is static and does not change if modifications are made to an organization's Salesforce configuration. Therefore, it is more flexible and adaptable than the Enterprise WSDL, which is strongly typed and bound to a specific configuration of Salesforce. References: Differences between Salesforce provided WSDL files

NEW QUESTION # 130

Universal Containers (UC) is a leading provider of management training globally, UC requested students course registration data generated from the Salesforce student community to be synced with the learning management system (LMS). Any update to the course registration data needs to be reflected in the LMS.

Which integration mechanism should be used to meet the requirement?

- A. Platform Event
- **B. Change Data Capture (CDC)**
- C. Streaming API
- D. Outbound Message

Answer: B

Explanation:

Change Data Capture (CDC) is the best option to meet the requirement. CDC is a type of streaming event that notifies subscribers of changes to Salesforce records, such as creation, update, delete, and undelete operations.

By subscribing to CDC events for the course registration data, the LMS can receive real-time updates and sync with Salesforce. Streaming API is another type of streaming event that notifies subscribers of changes to Salesforce records that match a SOQL query. However, Streaming API has some limitations, such as not supporting all SOQL features and not capturing delete and undelete operations. Platform Event is a type of streaming event that delivers custom notifications within the Salesforce platform or from external sources.

Platform Event is not suitable for this requirement because it is not tied to Salesforce records and requires custom logic to publish and subscribe. Outbound Message is a workflow action that sends SOAP messages with field values to designated endpoints. Outbound Message is not suitable for this requirement because it does not support complex data types, such as sObjects or collections.

NEW QUESTION # 131

A media company recently implemented an IAM system supporting SAML and OpenId. The IAM system must integrate with Salesforce to give new self-service customers instant access to Salesforce Community Cloud. Which requirement should Salesforce Community Cloud support for self-registration and SSO?

- A. OpenId Connect Authentication Provider and JIT provisioning
- **B. SAML SSO and Just-in-Time (JIT) provisioning**
- C. SAML SSO and Registration Handler

Answer: B

Explanation:

To provide "instant access" for new customers via an external IAM system using SAML, Salesforce provides a declarative feature called Just-in-Time (JIT) provisioning.

When a customer attempts to log in to the Community (Experience Cloud) through the IAM system, the IAM system (acting as the Identity Provider) sends a SAML assertion to Salesforce. If JIT provisioning is enabled, Salesforce parses the user information contained in that assertion—such as name, email, and federation ID. If a corresponding User record does not exist, Salesforce automatically creates one on-the-fly and then logs the user in. This eliminates the need for a manual registration step or pre-provisioning accounts.

Option A is slightly incorrect because Registration Handlers are specifically associated with Authentication Providers (which use OpenID Connect/OAuth), not SAML SSO. Option C is incorrect because JIT provisioning is a feature of SAML, while Authentication Providers use the Registration Handler class to achieve the same result. For a "self-service" scenario where speed to market and standard protocols are key, SAML SSO with JIT provisioning is the architect's primary choice for automating user management and providing a seamless single-entry point for subscribers.

NEW QUESTION # 132

Northern Trail Outfitters has a requirement to encrypt few of widely used standard fields. They also want to be able to use these fields in workflow rules.

Which security solution should an Integration Architect recommend to fulfill the business use case?

- A. Classic Encryption
- **B. Platform Shield Encryption**
- C. CryptographyClass

- D. Data Masking

Answer: B

Explanation:

Option D is correct because Platform Shield Encryption allows you to encrypt standard fields and use them in workflow rules.

Platform Shield Encryption uses AES 256-bit encryption to protect sensitive data at rest, while preserving platform functionality¹²

Option A is incorrect because Cryptography Class is a set of Apex methods for creating digests, message authentication codes, signatures, and encryption. It does not provide a way to encrypt standard fields or use them in workflow rules³

Option B is incorrect because Data Masking is a feature that replaces sensitive data in sandboxes with dummy data. It does not encrypt data in production or allow the use of encrypted data in workflow rules⁴⁵

Option C is incorrect because Classic Encryption is a feature that encrypts custom fields with 128-bit AES encryption. It does not support standard fields or workflow rules⁶⁷
