VMware vSphere 8.x Professional Sample Questions (Q106-Q111):

NEW QUESTION # 106

An administrator is deploying a new all flash vSAN cluster based on the vSAN Original Storage Architecture (OSA). What is the minimum supported network throughput in Gb/s for each host?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: C

Explanation:

The minimum supported network throughput in Gb/s for each host in an all flash vSAN cluster based on the vSAN Original Storage Architecture (OSA) is 10.

Reference:

vSAN Express Storage Architecture (ESA) are only supported with 25Gbps and higher connection speeds. ESA ReadyNodes configured for vSAN ESA will be configured with 25/50/100Gbps NICs. vSAN OSA all-flash configurations are only supported with a 10Gb or higher connections. One reason for this is that the improved performance with an all-flash configuration may consume more network bandwidth between the hosts to gain higher throughput. <https://core.vmware.com/resource/vmware-vsan-design-guide#sec6815-sub3>

NEW QUESTION # 107

An administrator manually configures a reference ESXi host that meets company security standards for vSphere environments. The administrator now needs to apply all of the security standards to every identically configured host across multiple vSphere clusters within a single VMware vCenter instance.

Which four steps would the administrator complete to meet this requirement? (Choose four.)

- A. Remediate all non-compliant hosts.
- B. Extract the host profile from the reference host
- C. Reset host customization on the reference host.
- D. Attach the host profile to each cluster that requires the secure configuration.
- E. Import host customization on the reference host.
- F. Check the compliance of each host against the host profile.
- G. Export the host profile from vCenter.

Answer: A,B,D,F

Explanation:

Explanation

To apply the security standards from a reference host to other hosts across multiple clusters, the administrator needs to extract a host profile from the reference host, which captures its configuration settings; attach the host profile to each cluster that requires the same configuration; check the compliance of each host against the host profile, which compares their settings; and remediate all non-compliant hosts, which applies the configuration settings from the host profile.

NEW QUESTION # 109

administrator successfully installs VMware ESXi onto the first host of a new vSphere cluster but makes no additional configuration changes. When attempting to log into the vSphere Host Client using the Fully Qualified Domain Name (FQDN) of the host, the administrator receives the following error message:

"server Not Found -we can't connect to the server at esxi101.corp.local."

- * Host FQDN: esxi101.corp.local
- * Management VLAN ID: 10
- * DHCP: No
- * Management IP Address: 172.16.10.101/24
- * Management IP Gateway: 172.16.10.1
- * Corporate DNS Servers: 172.16.10.5, 172.16.10.6
- * DNS Domain: corp.local

Which three high level tasks should the administrator complete, at a minimum, in order to successfully log into the vSphere Host Client using the FQDN for the esxi101 and complete the configuration (Choose three.)

- A. Disable IPv6 for the VMware ESXi Management Network.
- B. Update the VMware ESXi Management Network DNS configuration to use the corporate DNS servers for name, resolution,
- C. Configure at least two network adapters for the VMware ESXi Management Network.
- D. Update the VMware ESXi Management Network IPv4 configuration to use a static IPv4 address.
- E. Set the value of the VMware ESXi Management Network VLAN ID to 10.
- F. Ensure a DNS A Record is created for the VMware ESXi host on the corporate DNS servers,

Answer: B,F

Explanation:

To successfully log into the vSphere Host Client using the FQDN for the ESXi host, the administrator needs to ensure a DNS A Record is created for the VMware ESXi host on the corporate DNS servers, which maps its FQDN to its IP address; and update the VMware ESXi Management Network DNS configuration to use the corporate DNS servers for name resolution, which allows resolving its FQDN.

NEW QUESTION # 110

An administrator is preparing to perform an update to vSphere clusters that are running vSAN. The administrator wants to ensure that the following requirements are met as part of the update:

*All hosts in the cluster are updated with the same software.

*The firmware versions on the hosts are updated

*The new software versions are checked for compliance against the vSAN Hardware Compatibility List.

Which three steps should the administrator take to meet these requirements? (Choose three.)

- A. Download the firmware updates from the VMware website
- B. Run a hardware compatibility check using vSphere Lifecycle Manager
- C. Configure vSphere Lifecycle Manager with a baseline for the cluster.
- D. Register the vendor hardware management system as a vCenter Server extension.
- E. Configure vSphere Lifecycle Manager with an image for the cluster.

- F. Download the firmware updates from the vendor website.

Answer: B,D,E

Explanation:

Explanation

The administrator should take these three steps to perform an update to vSphere clusters that are running vSAN:
Configure vSphere Lifecycle Manager with an image for the cluster, which allows the administrator to specify the desired ESXi version and firmware for the hosts in the cluster.

Register the vendor hardware management system as a vCenter Server extension, which allows the administrator to update the firmware on the hosts using vSphere Lifecycle Manager. The vendor hardware management system can also provide the firmware updates to vSphere Lifecycle Manager, so there is no need to download them from the vendor website separately.

Run a hardware compatibility check using vSphere Lifecycle Manager, which verifies that the new software and firmware versions are compatible with the vSAN Hardware Compatibility List.
