Maybe our Development-Lifecycle-and-Deployment-Architect Dumps PDF is a better choice for you. It will help you get clear real exam quickly and effectively.

Salesforce Certified Development Lifecycle and Deployment Architect Sample Questions (Q155-Q160):

NEW QUESTION # 155

What are the three considerations that the architect should recommend for Change Set deployment?
Choose 3 answers

- A. Change Sets cannot be validated before deployment

- B. Change Sets cannot be automated..
- C. Change Sets cannot be rolled back.
- D. Change Sets cannot be reused between Production Salesforce orgs.
- E. Change Sets cannot be used for orgs affiliated with same production org.

Answer: B,C,D

NEW QUESTION # 156

Universal Containers is delivering many changes to its Salesforce system. Adoption reports are discovering that many features are unused. The steering committee wants this to change and is looking to the architect for advice.

What should an architect recommend to overcome this?

- A. Using Lightning Web Components for every user interface.
- B. Adopting user centered design to understand user needs before building the solution.
- C. Stop development until current features start being used.
- D. Sending weekly communication emails reporting on least engaged users

Answer: B

Explanation:

Explanation

User centered design is a process that involves understanding the user needs, preferences, and behaviors before building the solution. This way, the solution can be tailored to the user's goals and expectations, and increase the likelihood of adoption and satisfaction. Using Lightning Web Components, stopping development, or sending communication emails are not effective ways to overcome the problem of unused features.

NEW QUESTION # 157

Universal Containers (UC) is implementing a governance framework and has asked the Architect to make recommendations regarding release planning. Which two decisions should the Architect make when planning for releases? Choose 2 answers

- A. How to roll back to the previous Salesforce release if there are issues.
- B. When to test a new UC feature release if there are issues.
- C. How to test existing functionality to ensure no regressions are introduced.
- D. Whether Salesforce will wait to upgrade the pod until after a UC release is complete.

Answer: A,B

NEW QUESTION # 158

UC's scale of Salesforce deployment has increased over time, leading to complexities. UC is finding too many bugs in the deployed code, which has become a challenge to the delivery team. The team wants to reduce the amount of bugs by ensuring all the developed code is reviewed, tested, and validated in the upstream deployment process. Which three development practices will be best suited to address UC's concerns? Choose 3

- A. Enable a short and timely feedback loop with customers
- B. Incorporate test-driven deployment into the project structure.
- C. Enable developer teams to do peer code review.
- D. Use continuous integration with automation testing.
- E. Encourage the development team to be self-organizing.

Answer: B,C,D

Explanation:

Using continuous integration with automation testing is a development practice that will help to reduce the amount of bugs, as it allows the code to be built and tested frequently and automatically. Encouraging the development team to do peer code review is a development practice that will help to reduce the amount of bugs, as it allows the code to be checked and improved by other developers. Incorporating test-driven development into the project structure is a development practice that will help to reduce the amount of bugs, as it requires the developers to write tests before writing code and ensure that the code meets the test criteria.

Enabling the development team to be self-organizing is not a development practice that will help to reduce the amount of bugs, as it does not directly affect the quality of the code. Enabling a short and timely feedback loop with customers is not a development practice that will help to reduce the amount of bugs, as it does not directly affect the quality of the code.

NEW QUESTION # 159

What two things are needed to delete metadata with a deploy() call? = Choose 2 answers

- A. **DestructiveChanges.xml file.**
- B. PurgeOnDelete option must be set to TRUE.
- C. **Package.XML file.**
- D. The CURRENT API version must be used.

Answer: A,C

Explanation:

Explanation

To delete metadata with a deploy() call, two things are needed: a package.xml file and a destructiveChanges.xml file. The package.xml file specifies the API version and the components to be deployed, while the destructiveChanges.xml file specifies the components to be deleted. The API version does not have to be the current one, as long as it is compatible with the components. The purgeOnDelete option is not required, as it only determines whether the deleted components are stored in the recycle bin or not.

NEW QUESTION # 160

.....

Why do we need so many certifications? One thing has to admit, more and more certifications you own, it may bring you more opportunities to obtain a better job, earn more salary.
