真実的-ハイパスレートのPAP-001認定デベロッパー試験-試験の準備方法PAP-001日本語版試験解答

皆が知っているように、試験はほとんどの学生にとって難しい問題ですが、テストPAP-001認定を取得し、関連する証明書を取得することは、労働者にとって非常に重要です。ただし、幸いなことに、この種の問題を心配する必要はありません。最良のソリューションであるPAP-001実践教材を見つけることができます。当社の技術と継続的な投資と研究の補助設備により、当社の将来は明るいです。PAP-001学習ツールには多くの利点があり、PAP-001試験問題の合格率は99%~100%です。

Ping Identity PAP-001 認定試験の出題範囲:

トピック	出題範囲
トピック 1	<ul style="list-style-type: none"> Product Overview: This section of the exam measures skills of Security Administrators and focuses on understanding PingAccess features, functionality, and its primary use cases. It also covers how PingAccess integrates with other Ping products to support secure access management solutions.
トピック 2	<ul style="list-style-type: none"> General Maintenance and File System: This section of the exam measures the skills of System Engineers and addresses maintenance tasks such as license management, backups, configuration imports or exports, auditing, and product upgrades. It also includes the purpose of log files and an overview of the PingAccess file system structure with important configuration files.
トピック 3	<ul style="list-style-type: none"> Integrations: This section of the exam measures skills of System Engineers and explains how PingAccess integrates with token providers, OAuth and OpenID Connect configurations, and site authenticators. It also includes the use of agents and securing web, API, and combined applications through appropriate integration settings.

Ping Identity Certified Professional - PingAccess 認定 PAP-001 試験問題 (Q45-Q50):

質問 # 45

Anycompany has several applications that need to load images and fonts from www.anycompany.com. Users are currently getting CORS errors. How should the Cross-Origin Request rule be set to allow secure access?

- A. Allowed Origins to *.anycompany.com and disable the Allow Credentials option
- B. Allowed Origins to * and enable the Allow Credentials option
- C. Allowed Origins to www.anycompany.com and enable the Allow Credentials option
- D. Allowed Origins value for each of the listed domains

正解: C

解説:

To prevent CORS errors, administrators must configure a Cross-Origin Request (CORS) Processing Rule.

The secure practice is to allow the specific trusted domain (www.anycompany.com) and, when cookies or credentials are required, to enable Allow Credentials.

Exact Extract:

"For secure CORS, specify exact origins rather than wildcards. Enable 'Allow Credentials' when client-side resources must include cookies or authentication data."

* Option A is incomplete - multiple values are possible, but in this case only www.anycompany.com is required.

* Option B is less secure - using a wildcard (*.anycompany.com) broadens exposure unnecessarily.

* Option C is insecure - * with credentials is disallowed by CORS specifications.

* Option D is correct - restricts access to the trusted domain and allows credentialed requests.

Reference: PingAccess Administration Guide - Cross-Origin Request Rule

質問 # 46

All style sheets should be accessible to all users without authentication across all applications. Which configuration option should the administrator use?

- A. Define Authentication Challenge Policy of none for the resource.
- B. Define a Default Availability Profile of on-demand for the resource.
- C. Define a Protocol Source for the resource.

- **D. Define Global Unprotected Resources for the resource.**

正解: D

解説:

The correct way to ensure resources such as CSS files, images, or JavaScript are accessible without authentication across all applications is to configure Global Unprotected Resources.

Exact Extract:

"Global unprotected resources define resources that do not require authentication and are accessible to all clients across applications."

- * Option A is incorrect; Protocol Sources define back-end host connections, not authentication.
- * Option B would apply only per-resource, not across all applications.
- * Option C is correct - Global Unprotected Resources are designed for this exact purpose.
- * Option D (Availability Profile) is related to application health checks and availability, not authentication.

Reference: PingAccess Administration Guide - Global Unprotected Resources

質問 # 47

Which two browsers are supported for the PingAccess Admin console? (Choose 2 answers.)

- **A. Microsoft Edge**
- B. Brave
- C. Apple Safari
- **D. Google Chrome**
- E. Opera

正解: A、D

解説:

PingAccess officially supports Google Chrome and Microsoft Edge for the administrative console. Other browsers (Safari, Opera, Brave) may work but are not officially supported.

Exact Extract:

"The PingAccess administrative console is supported on current versions of Google Chrome and Microsoft Edge."

- * Option A (Safari) is not officially supported.
- * Option B (Opera) is not supported.
- * Option C (Google Chrome) is correct.
- * Option D (Microsoft Edge) is correct.
- * Option E (Brave) is not officially supported.

質問 # 48

A financial application should be prompted for step-up authentication on a URL that allows money transfers.

A previous administrator configured rules to be applied on the required application URL. Users are not prompted for step-up authentication when accessing the /sranafemmeneyURL endpoint.

Which two actions should the administrator take? (Choose 2 answers.)

- **A. Make sure that the existing rule's authentication requirements contain the appropriate minimum authentication requirements**
- **B. Verify that an authentication requirement rule is applied to the application to see if a user has met the required authentication context**
- C. Make sure that the existing rule's token validation contains the appropriate minimum authentication requirements
- D. Verify that a rejection handler rule exists and is applied to the application to see if a user has met the required authentication context
- E. Create a new identity mapping containing authentication context values and add the mapping to the existing rule

正解: A、B

解説:

Step-up authentication in PingAccess is enforced through Authentication Requirement Rules. If users are not prompted, the likely issues are:

- * The rule is missing from the application/resource.

* The rule's minimum authentication context does not include MFA.

Exact Extract:

"Authentication requirement rules determine whether PingAccess will challenge a user with additional authentication (such as MFA).

Ensure that the rule is applied to the resource and that the authentication context is set correctly."

* Option A is incorrect - rejection handlers define error handling, not MFA enforcement.

* Option B is correct - verify the authentication requirement rule is applied.

* Option C is correct - ensure the rule contains the right MFA requirements.

* Option D is incorrect - identity mappings do not enforce step-up authentication.

* Option E is incorrect - token validation rules check validity, not MFA levels.

質問 # 49

A protected web application requires that additional attributes be provided once the user is authenticated.

Which two steps must the administrator perform to meet this requirement? (Choose 2 answers.)

- A. Update the Site Authenticator.
- **B. Update the Web Session.**
- C. Request that the token provider update the ID token with the additional attributes.
- D. Request that the token provider update the access token with the additional attributes.
- **E. Update the Identity Mapping.**

正解: B、E

解説:

When applications require additional attributes:

* The Web Session must be configured to retrieve those attributes from the token provider (OIDC or PingFederate).

* The Identity Mapping must be updated to forward those attributes to the application (e.g., as headers).

Exact Extract:

"Web sessions define how user attributes are retrieved from the token provider. Identity mappings determine how those attributes are inserted into requests to applications."

* Option A is not necessarily required; attributes can be retrieved via userinfo endpoint or access token, not only ID tokens.

* Option B is correct - Identity Mappings must be updated to pass attributes to the app.

* Option C is incorrect - Site Authenticators define how PingAccess authenticates to apps, not attribute handling.

* Option D is incorrect unless the architecture specifically requires access token updates; PingAccess often uses the Web Session to fetch attributes.

* Option E is correct - Web Session must be updated to retrieve additional attributes.
