

Integration-Architect Kostenlos Downloaden, Integration-Architect Demotesten

Die Materialien zur Salesforce Integration-Architect Zertifizierungsprüfung von Fast2test werden speziell von dem IT-Expertenteam entworfen. Sie sind zielgerichtet. Durch die Zertifizierung können Sie Ihren internationalen Wert in der IT-Branche verwirklichen. Viele Anbieter für Antwortenspeicherung und die Schulungsunterlagen versprechen, dass Sie die Salesforce Integration-Architect Zertifizierungsprüfung mit ihren Produkten bestehen können. Fast2test sagen mit den Beweisen. Der Moment, wenn das Wunder vorkommt, kann jedes Wort von uns beweisen.

Salesforce Certified Integration Architect Integration-Architect Prüfungsfragen mit Lösungen (Q118-Q123):

118. Frage

Customer is evaluating Platform Events solution and would like help in comparing/contrasting it with Outbound Message for a real-time / near-real time needs. They expect 3,000 consumers of messages from Salesforce.

Which three considerations should be evaluated and highlighted when deciding between the solutions?

Choose 3 answers

- A. Number of concurrent subscribers to Platform Events is capped at 2,000. An Outbound Message configuration can pass only 100 notifications in a single message to a SOAP end point.
- B. Both Platform Events and Outbound Message are highly scalable. However, unlike Outbound Message, only Platform Events have Event Delivery and Event Publishing limits to be considered.
- C. Both Platform Events and Outbound Message offer declarative means for asynchronous near-real time needs. They aren't best suited for real-time integrations.
- D. In both Platform Events and Outbound Messages, the event messages are retried by and delivered in sequence, and only once. Salesforce ensures there is no duplicate message delivery.
- E. Message sequence is possible in Outbound Message but not guaranteed with Platform Events. Both offer very high reliability. Fault handling and recovery are fully handled by Salesforce.

Antwort: A,B,D

Begründung:

Explanation

Both Platform Events and Outbound Message offer declarative means for asynchronous near-real time needs.

They aren't best suited for real-time integrations (A). In both Platform Events and Outbound Messages, the event messages are retried by and delivered in sequence, and only once. Salesforce ensures there is no duplicate message delivery (B). Message sequence is possible in Outbound Message but not guaranteed with Platform Events. Both offer very high reliability. Fault handling and recovery are fully handled by Salesforce

Number of concurrent subscribers to Platform Events is capped at 2,000. An Outbound Message configuration can pass only 100 notifications in a single message to a SOAP end point (D). Both Platform Events and Outbound Message are highly scalable.

However, unlike Outbound Message, only Platform Events have Event Delivery and Event Publishing limits to be considered (E).

119. Frage

Northern Trail Outfitters has recently implemented middleware for orchestration of services across platforms.

The Enterprise Resource Planning (ERP) system being used requires transactions be captured near real-time at a REST endpoint initiated in Salesforce when creating an Order object. Additionally, the Salesforce team has limited development resources and requires a low-code solution. Which option should fulfill the use case requirements?

- A. Use Lightning Flow to create a platform event, selecting the record type as the platform event name on insert of record.
- B. Use Remote Process Invocation fire and forget pattern on insert on the order object using Flow Builder.
- C. Implement Change Data Capture on the Order object and leverage the replay ID in the middleware solution.

Antwort: B

Begründung:

To satisfy a requirement for near real-time REST updates with limited development resources, the architect should utilize Flow Builder. Flow Builder is Salesforce's primary low-code tool for automating complex business logic and outbound integrations. The Remote Process Invocation-Fire and Forget pattern is the most efficient way to signal an external system (or middleware) that a record was created without blocking the user. Using a Record-Triggered Flow on the Order object, the architect can configure an Action (such as an External Service or a simple HTTP Callout) to send the order data to the middleware's REST endpoint. Option A is slightly incorrect because creating a platform event is just one step in an event-driven flow; the "Fire and Forget" pattern more accurately describes the end-to-end intent. Option B (Change Data Capture) is a powerful tool, but it is considered a "pro-code" or high-configuration solution on the middleware side, requiring the middleware to manage Replay IDs and Bayeux subscriptions. Option C leverages the native strengths of Flow to fulfill the requirement declaratively, allowing the team to deliver a functional integration without writing Apex code while meeting the near-real-time performance expectations of the ERP.

120. Frage

Universal learning (UC) is embarked on Salesforce transformation journey, UC will decommission the legacy CRM system and migrate data to Salesforce. The data migration team asked for a recommendation to optimize the performance of the data load to Salesforce.

Which approach should be used to meet the requirement?

- A. Use Bulk API to process jobs in parallel mode.
- B. Use Bulk API to process jobs in serial mode.
- C. Contact Salesforce support to schedule performance load.
- D. Use Bulk API to process jobs in high performance mode.

Antwort: A

121. Frage

business requires automating the check and update of the phone number type classification (mobile vs. landline) for all in-coming calls delivered to their phone sales agents. The following conditions exist:

1. At peak, their call center can receive up to 100,000 calls per day.
2. The phone number type classification is a service provided by an external service API.
3. Business is flexible with timing and frequency to check and update the records (throughout the night or every 6-12 hours is sufficient).

A Remote-Call-In pattern and/or Batch Synchronization (Replication via ETL: System -> Salesforce) are determined to work with a middleware hosted on custom premise.

In order to implement these patterns and mechanisms, which component should an integration architect recommend?

- A. Firewall and reverse proxy are required to protect internal APIs and resource being exposed.
- B. Configure Remote Site Settings in Salesforce to authenticate the middleware.
- C. An API Gateway that authenticates requests from Salesforce into the Middleware (ETL/ESB).
- D. ConnectedApp configured in Salesforce to authenticate the middleware.

Antwort: D

Begründung:

Explanation

A Connected App is a framework that enables an external application to integrate with Salesforce using APIs and standard protocols, such as OAuth. By configuring a Connected App in Salesforce, the integration can authenticate the middleware and grant access to the Salesforce data and services. This is a secure and flexible solution that does not require configuring Remote Site Settings, API Gateway, or Firewall and reverse proxy. References: 1: Batch Apex Error Event 2: Connected Apps

122. Frage

Northern Trail Outfitters is planning to perform nightly batch loads into Salesforce from an external system with a custom Java application using the and the CIO is curious about monitoring recommendations for the jobs from the Technical Architect Which two recommendations will help meet the requirements?

Choose 2 answers

- A. Write the error response from the Bulk API status to a custom error logging object in Salesforce using an Apex trigger and create reports on the object.
- B. Set the Salesforce debug logs level to "finest" and add the user Id running the job to monitor in the "Debug Logs" in the setup menu.
- C. Visually monitor in the Salesforce UI using the "Bulk Data Load Jobs in Salesforce in the setup menu.
- D. Use the `getBatchInfo` method in the Java application to monitor the status of the jobs from the Java application.

Antwort: C,D

Begründung:

Explanation

Visually monitor in the Salesforce UI using the "Bulk Data Load Jobs" in Salesforce in the setup menu, and use the `getBatchInfo` method in the Java application to monitor the status of the jobs from the Java application.

These two methods can help the Technical Architect to monitor the nightly batch loads into Salesforce from an external system with a custom Java application using the Bulk API. The "Bulk Data Load Jobs" page in Salesforce shows the status, progress, and results of each batch load job. The `getBatchInfo` method in the Java application returns a `BatchInfo` object that contains information about a batch, such as its ID, state, number of records processed, and number of errors. 123. Frage

.....

Mit der Ankunft der Flut des Informationszeitalters im 21. Jahrhundert müssen die Menschen ihre Kenntnisse verbessern, um sich dem Zeitalter anzupassen. Aber das ist noch nicht genügend. In der IT-Branche ist Salesforce Integration-Architect Zertifizierungsprüfung ganz notwendig. Aber diese Prüfung ist ganz schwierig. Sie können auch internationale Anerkennung und Akzeptanz erhalten, eine glänzende Zukunft haben und ein hohes Gehalt beziehen. Fast2test verfügt über die weltweit zuverlässigsten IT-Schulungsmaterialien und mit ihm können Sie Ihre wunderbare Pläne realisieren. Wir garantieren Ihnen 100%, die Prüfung zu bestehen. Bewerber, die an der Salesforce Integration-Architect Zertifizierungsprüfung teilnehmen, warum zögern Sie noch. Schnell, bitte!
