AWS-Certified-Developer-Associate exam is designed to test a candidate's expertise in developing and deploying applications on the Amazon Web Services (AWS) platform. It is an industry-recognized certification that demonstrates a candidate's ability to design, develop, and maintain AWS-based applications.

Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample

Questions (Q101-Q106):

NEW QUESTION # 101

An on-premises legacy application is caching data files locally and writing shared images to local disks. What is necessary to allow for horizontal scaling when migrating the application to AWS?

- A. Modify the application to use Amazon S3 for serving shared images; cache data can then be written to local disks.
- B. Modify the application to read and write cache data on Amazon S3, while continuing to write shared images to local disks.
- C. Modify the application to have both shared images and caching data written to Amazon EBS.
- D. Modify the application to read and write cache data on Amazon S3, and also store shared images on S3.

Answer: D

NEW QUESTION # 102

Developer is creating an AWS Lambda function to process a stream of data from an Amazon Kinesis Data Stream. When the Lambda function parses the data and encounters a missing field, it exits the function with an error. The function is generating duplicate records from the Kinesis stream. When the Developer looks at the stream output without the Lambda function, there are no duplicate records.

What is the reason for the duplicates?

- A. The Lambda event source used asynchronous invocation, resulting in duplicate records.
- B. The Lambda function did not advance the Kinesis stream pointer to the next record after the error.
- C. The Lambda function did not handle the error, and the Lambda service attempted to reprocess the data.
- D. The Lambda function is not keeping up with the amount of data coming from the stream.

Answer: B

NEW QUESTION # 103

A Developer is working on an application that tracks hundreds of millions of product reviews in an Amazon DynamoDB table. The records include the data elements shown in the table:

Name	Type	Description
reviewID	Number	16 digit UUID
starRating	Number	Integer 1-5 of user rating
comment	String	User comment string
productID	Number	Product ID being reviewed

Which field, when used as the partition key, would result in the MOST consistent performance using DynamoDB?

- A. productID
- B. comment
- C. reviewID
- D. starRating

Answer: A

Explanation:

Explanation

Refer AWS documentation - DynamoDB Design partition key

The partition key portion of a table's primary key determines the logical partitions in which a table's data is stored. This in turn affects the underlying physical partitions. Provisioned I/O capacity for the table is divided evenly among these physical partitions. Therefore a partition key design that doesn't distribute I/O requests evenly can create "hot" partitions that result in throttling and use your provisioned I/O capacity inefficiently.

The optimal usage of a table's provisioned throughput depends not only on the workload patterns of individual items, but also on the partition-key design. This doesn't mean that you must access all partition key values to achieve an efficient throughput level, or even that the percentage of accessed partition key values must be high. It does mean that the more distinct partition key values that your workload accesses, the more those requests will be spread across the partitioned space. In general, you will use your provisioned throughput more efficiently as the ratio of partition key values accessed to the total number of partition key values increases.

NEW QUESTION # 104

A Developer is writing a serverless application that requires that an AWS Lambda function be invoked every 10 minutes. What is an automated and serverless way to trigger the function?

- A. Deploy an Amazon EC2 instance based on Linux, and edit its /etc/crontab file by adding a command to periodically invoke the Lambda function.
- B. Configure an environment variable named PERIOD for the Lambda function. Set the value to 600.
- C. Create an Amazon SNS topic that has a subscription to the Lambda function with a 600-second timer.
- **D. Create an Amazon CloudWatch Events rule that triggers on a regular schedule to invoke the Lambda function.**

Answer: D

NEW QUESTION # 105

An AWS Lambda function must read data from an Amazon RDS MySQL database in a VPC and also reach a public endpoint over the internet to get additional data.

Which steps must be taken to allow the function to access both the RDS resource and the public endpoint?
(Choose two.)

- A. Add an environmental variable to the Lambda function to allow outbound internet access.
- B. Modify the default configuration of the Lambda function to associate it with a VPC public subnet.
- **C. Modify the default configuration for the Lambda function to associate it with an Amazon VPC private subnet.**
- D. Modify the default network access control list to allow outbound traffic.
- **E. Add a NAT Gateway to the VPC.**

Answer: C,E
