If you do all things with efficient, you will have a promotion easily. If you want to spend less time on preparing for your Data-Driven-Decision-Making exam, if you want to pass your exam and get the certification in a short time, our Data-Driven-Decision-Making Study Materials will be your best choice to help you achieve your dream. Only studying with our Data-Driven-Decision-Making learning engine for 20 to 30 hours, we can claim that you can pass your exam without difficulty.

Our Data-Driven-Decision-Making learning questions are famous for that they are undeniable excellent products full of benefits, so our exam materials can spruce up our own company image. Besides, our Data-Driven-Decision-Making study quiz is priced reasonably, so we do not overcharge you at all. Not only the office staff can buy it, the students can also afford it. Meanwhile, our Data-Driven-Decision-Making Exam Materials are demonstrably high effective to help you get the essence of the knowledge which was convoluted. You will get more than you can imagine by our Data-Driven-Decision-Making learning guide.

The superiority of our Data-Driven-Decision-Making practice materials is undeniable. We are superior in both content and a series of considerate services. We made the practice materials for conscience's sake to offer help. Our Data-Driven-Decision-Making actual exam withstands the experiment of the market also. With the help from our Data-Driven-Decision-Making training engine, passing the exam will not be a fiddly thing anymore. So this is your high time to flex your muscles this time.

## WGU VPC2Data-Driven Decision MakingC207 Sample Questions (Q41-Q46):

### NEW QUESTION # 41

An analyst used multiple linear regression to show how a big box store's sales ( $y$ ) are predicted by the big box store's advertising expenditure in dollars (variable  $x_1$ ) and the advertising expenditure in dollars of a specialty store (variable  $x_2$ ) in the same market. The estimated regression is  $y = 651.57 + 92.30x_1 + 26.89x_2$ . How are advertising expenditures and sales related in this scenario?

- A. If the specialty store increases its advertising expenditures, it will decrease the big box store's sales.
- B. If the big box store decreases its advertising expenditures, its sales will increase.
- C. If the big box store increases its advertising expenditures, its sales will decrease.
- D. If the big box store decreases its advertising expenditures, it will decrease the big box store's sales.

**Answer: A**

**NEW QUESTION # 42**

A clothing company wants to predict sales figures based on the amount spent on advertising. Which type of regression analysis should this company use?

- A. Time series regression
- **B. Linear regression**
- C. Logistic regression
- D. Multiple linear regression

**Answer: B**

Explanation:

When predicting a continuous outcome based on a single predictor, data-driven decision making recommends simple linear regression. In this case, sales figures are continuous, and advertising spend is a single explanatory variable.

Linear regression models the relationship between one independent variable and one dependent variable by estimating a straight-line relationship. Time series regression is used when data are indexed over time, logistic regression is used for binary outcomes, and multiple linear regression requires multiple predictors.

Because the company is using only advertising spend to predict sales, linear regression is the most appropriate method. Therefore, the correct answer is B.

**NEW QUESTION # 43**

How does Six Sigma relate to a firm's application of a control chart?

- A. It is equivalent to linear programming.
- B. It produces a balanced scorecard.
- C. It measures supplier and input reliability.
- **D. It continually measures processes and outputs.**

**Answer: D**

Explanation:

Six Sigma is a quality management methodology focused on reducing defects, minimizing variation, and improving process performance through data-driven analysis. Control charts are one of the statistical process control tools commonly used within Six Sigma because they allow firms to continually measure processes and outputs over time. By tracking data points against control limits, organizations can determine whether a process is operating normally or whether unusual variation requires investigation. This ongoing measurement supports the Six Sigma goal of achieving highly consistent performance and identifying sources of error early. The other options do not accurately describe the relationship. Six Sigma is not equivalent to linear programming, which is an optimization technique. It also does not directly produce a balanced scorecard, which is a broader strategic performance framework. Although supplier and input reliability may matter in quality management, that is not the primary connection between Six Sigma and control charts. Therefore, the best answer is that Six Sigma continually measures processes and outputs through tools such as control charts.

**NEW QUESTION # 44**

Two project teams are assigned to upgrade an on-premise data warehouse to a cloud-based data lake in 13 months. The infrastructure team has five team members, while the enterprise analytics team has three team members. The enterprise analytics team cannot move into production until the infrastructure team has completed the migration.

What should be used to find the probability that the project will be completed on time?

- A. Bayes' theorem
- B. Multiplication principle
- **C. Conditional probability**
- D. Combination

**Answer: C**

Explanation:

This scenario requires the use of **conditional probability**, which applies when the likelihood of one event depends on the occurrence of another event. In data-driven decision making, conditional probability is used to model dependent events within processes, workflows, and project timelines.

In this case, the enterprise analytics team's ability to move into production is **dependent on** the infrastructure team completing the migration. Because one event cannot occur unless another event has already occurred, the probability of completing the project on time must account for this dependency.

The multiplication principle applies to independent events, Bayes' theorem updates probabilities based on new information, and combinations are used for counting outcomes, not dependency analysis. Conditional probability explicitly captures the relationship between dependent tasks.

Project risk analysis and scheduling often rely on conditional probability to assess completion likelihood when tasks are sequentially linked. Therefore, the correct answer is **C**, conditional probability.

#### NEW QUESTION # 45

What is true about outliers?

Choose 2 answers.

- A. All outliers are statistically significant when using a normal distribution.
- **B. Outliers that are miskeyed can be corrected prior to analysis.**
- **C. Outliers detected in a study are useful in determining if something does not belong in the study.**
- D. All observed outliers should be eliminated from a study prior to analysis.

**Answer: B,C**

Explanation:

Outliers are observations that differ substantially from the rest of the data, but they are not automatically errors and should not be removed without investigation. One correct statement is that miskeyed outliers can be corrected before analysis. For example, if a value of 500 is entered instead of 50, this is a data-entry error, not a meaningful observation, and it should be fixed using source verification. Another correct statement is that outliers can help determine whether something does not belong in the study. They may reveal invalid records, unusual conditions, a different population, process breakdowns, or rare but important events. The incorrect choices are too absolute. Not all outliers are statistically significant, even under a normal distribution, because significance depends on context, sample size, and method. Likewise, not all observed outliers should be eliminated. Some outliers contain valuable information and can indicate real variation that deserves attention. In quality control, fraud detection, medical screening, and operational monitoring, outliers may be among the most important data points. Therefore, the correct answers are the ones that recognize both correction of miskeyed values and the analytical value of identifying unusual observations.
