Free PDF 2026 Useful CSA: ServiceNow Certified System Administrator Authorized Exam Dumps

The CSA practice exam we offered is designed with the real questions that will help you in enhancing your knowledge about the CSA certification exam. Our online test engine will improve your ability to solve the difficulty of CSA Real Questions and get used to the atmosphere of the formal test. Our experts created the valid CSA study guide for most of candidates to help them get good

result with less time and money.

ServiceNow CSA Exam is designed for professionals who work with ServiceNow on a regular basis, including system administrators, implementation specialists, developers, and consultants. CSA exam is an industry-recognized certification that can help individuals advance their careers and increase their earning potential. It is also a requirement for certain ServiceNow partner programs.

ServiceNow Certified System Administrator Sample Questions (Q248-Q253):

NEW QUESTION # 248

Which is the base table of the configuration management database hierarchy?

- A. cmdb_d
- **B. cmdb**
- C. ucmbd
- D. cmdb_ret_Oi

Answer: B

Explanation:

In ServiceNow's Configuration Management Database (CMDB), the cmdb table is the base table from which all Configuration Item (CI) tables inherit.

cmdb is the Parent Table of All CMDB-Related Tables

The cmdb table contains basic attributes shared by all Configuration Items (CIs).

Every CI in ServiceNow inherits from cmdb or one of its child tables.

Hierarchy of CMDB Tables in ServiceNow:

cmdb (Base Table) # Stores general CI data.

cmdb_ci (Stores specific CI details) # Extends cmdb to store devices, applications, and services.

cmdb_rel_ci (Stores relationships between CIs) # Used to track dependencies.

Why is cmdb the Correct Answer?

A: cmdb_d Incorrect - No such standard table exists in ServiceNow's CMDB.

B: cmdb Incorrect - uCMDB (Universal CMDB) is an HP product, not part of ServiceNow's CMDB.

C: cmdb_rel_ci Incorrect - This table stores CI relationships, but it is not the base table.

Incorrect Answer Choices Analysis:

ServiceNow Docs - CMDB Core Tables # CMDB Table Structure

NEW QUESTION # 249

IntegrationHub enables execution of third-party APIs as a part of a flow. These integrations are referred to as

- A. a connection
- B. an action
- **C. a spoke**
- D. an integration step

Answer: C

Explanation:

In ServiceNow IntegrationHub, third-party API integrations within a Flow Designer flow are known as spokes. A spoke is a scoped application containing Flow Designer actions and subflows that allow the flow to interact with external systems or ServiceNow applications.

Key Concepts Related to IntegrationHub and Spokes

Spokes in IntegrationHub

A spoke is a collection of predefined and custom actions, subflows, and data streams used to integrate with external systems.

Spokes provide a no-code/low-code approach to integrating third-party applications.

Examples of prebuilt spokes available in ServiceNow include:

Slack Spoke (for Slack API integrations)

Microsoft Teams Spoke (for Teams integration)

Jira Spoke (for integrating with Atlassian Jira)

How Spokes Work

When a flow needs to interact with an external system (e.g., sending data to Jira or retrieving information from Slack), it calls an action from a spoke.

Each spoke contains multiple predefined actions that execute API requests or perform tasks like creating records, updating data, or fetching information.

Comparison with Other Options

A . an action → Incorrect

Actions are individual steps in a flow, not the complete integration package. Actions exist inside spokes.

C . a connection → Incorrect

A connection is a configuration that stores authentication details (e.g., API keys, OAuth tokens) used by a spoke.

D . an integration step → Incorrect

No such term as "integration step" exists in ServiceNow IntegrationHub.

NEW QUESTION # 250

On the CI Dependency View, what enables you to trace from an infrastructure item, like a Server, to the Services that are dependent on that Server?

- A. Automapping Utility
- B. Transform Map
- C. Relationships
- D. Service Tracer

Answer: C

Explanation:

The CI Dependency View in ServiceNow visualizes relationships between Configuration Items (CIs), allowing IT teams to trace dependencies between infrastructure components, such as servers, applications, and services.

Key Concept: CI Relationships

Relationships define dependencies between Configuration Items (CIs) in the Configuration Management Database (CMDB).

The CI Dependency View uses relationships to map infrastructure components and their service dependencies.

Example Scenario:

A Server (CI) hosts a Database (CI) → The database supports an Application (CI) → The application provides a Service (CI).

By viewing CI Relationships, you can trace failures upstream or downstream to understand the impact.

Why Other Options Are Incorrect?

A . Service Tracer → ☐ Incorrect

No such feature called "Service Tracer" exists in ServiceNow.

B . Automapping Utility → ☐ Incorrect

Auto-Discovery tools help populate the CMDB, but they do not enable tracing in the CI Dependency View.

D . Transform Map → ☐ Incorrect

Transform Maps are used in Import Sets to map data between tables, not for dependency mapping.

NEW QUESTION # 251

When managing tags, you can adjust who is able to see iL What are the visibility options?

Choose 3 answers

- A. Roles and Permissions
- B. Groups and Users
- C. Everyone
- D. Me
- E. Admins

Answer: B,C,D

Explanation:

In ServiceNow, tags are used to categorize and organize records for quick access. When managing tags, users can control their visibility by setting who can see them.

B: Everyone

The tag is public and visible to all users in the instance.

Example: A Service Desk team creates a "High Priority" tag that everyone can use.

C: Groups and Users

Tags can be restricted to specific groups or individual users.

Example: A Security Team creates a tag only visible to IT Security staff.

E: Me

Tags can be private, meaning only the creator (you) can see them.

Example: A user creates a "Follow-up" tag for their own personal tracking.

A: Admins

Incorrect- Admins can manage tags, but "Admins" is not a visibility setting.

Instead, visibility is set to Everyone, Groups, or Me.

D: Roles and Permissions

Incorrect terminology- ServiceNow does not provide a tag visibility setting based on "Roles and Permissions." Tags are assigned based on specific users or groups, not roles.

ServiceNow User Guide: Configuring and Sharing Tags

NEW QUESTION # 252

Your company is giving all first line workers a special T-shirt as a recognition for their hard work. Management team wants a way for employees to order the T-shirt, with the ability to specify the preferred size and color. How would you ensure that only first line workers (non-managers) can submit the order?

- A. Create Record Producer and use the Available For list to specify First Line [sn_first_line] role
- B. Create Catalog Item and use the Not Available list to specify the Manager Group
- C. Create Catalog Item and use the Available For list to specify ITIL [itil] role
- D. Create Order Guide and use the User Criteria list to specify First Line [sn_first_line] role

Answer: A

Explanation:

In ServiceNow, Record Producers allow users to create records in tables through a user-friendly interface in the Service Catalog. Since the goal is to enable only first-line workers to order the T-shirt, we need to control access based on their role.

Why is Option A Correct?

A Record Producer in the Service Catalog is the best way to gather user input (size, color, etc.) and create a new order record in the system.

The "Available For" list allows administrators to restrict access to specific users or roles.

The First Line [sn_first_line] role is explicitly designed to include only first-line workers while excluding managers.

Why Are the Other Options Incorrect?

☐ B. Create Catalog Item and use the Not Available list to specify the Manager Group Catalog Items are valid for this use case but using the "Not Available For" list is a less effective approach.

If new manager roles or groups are added in the future, this method won't automatically exclude them.

It's better to explicitly define who can access the item rather than relying on exclusions.

☐ C. Create Catalog Item and use the Available For list to specify ITIL [itil] role The ITIL role is typically assigned to Service Desk personnel and IT staff, not first-line workers.

This approach would allow many unintended users to request the T-shirt.

☐ D. Create Order Guide and use the User Criteria list to specify First Line [sn_first_line] role Order Guides are used to bundle multiple catalog items and guide users through a complex ordering process.

Since this scenario only involves a single item (T-shirt request), using an Order Guide is unnecessary.
