Salesforce Certified MuleSoft Developer (Mule-Dev-201) Sample Questions (Q39-Q44):

NEW QUESTION # 39
An API instance of type API endpoint with API proxy is created in API manager using an API specification from Anypoint Exchange. The API instance is also configured with an API proxy that is deployed and running in CloudHub.
An SLA- based policy is enabled in API manager for this API instance.
Where can an external API consumer obtain a valid client ID and client secret to successfully send requests to the API proxy?

- A. In the organization's public API portal in Anypoint Exchange, from an approved client application for the API proxy
- B. In Runtime Manager, from the properties tab of the deployed approved API proxy
- C. In Anypoint Studio, from components generated by Rest Connect for API specification
- D. In Anypoint Studio, from components generated by APIkit for the API specification

Answer: A

Explanation:
* When a client application is registered in Anypoint Platform, a pair of credentials consisting of a client ID and client secret is generated.
* When the client application requests access to an API, a contract is created between the application and that API.
* An API that is protected with a Client ID Enforcement policy is accessible only to applications that have an approved contract.

---- In the organization's public API portal in Anypoint Exchange, from an approved client application for the API proxy

NEW QUESTION # 41

Refer to the exhibits The Mule application does NOT define any global error handlers.

A web client sends a POST request to the Multi application with this input payload The File Write operation throws a FILECONNECTIVITY error What response message is returned to the web client?

```
<flow name="acceptOrder">
    <http:listener doc:name="HTTP: POST /order" config-ref="HTTP_Listener_config"
        path="/order" allowedMethods="POST">
        <http:error-response >
            <http:body ><![CDATA[#[output text/plain --- payload]]]></http:body>
        </http:error-response>
    </http:listener>
    <file:write doc:name="Write" config-ref="File_Config" path="newOrder.json">
        <error-mapping sourceType="FILE:CONNECTIVITY" targetType="ORDER:NOT_CREATED" />
        <file:content ><![CDATA[#[output appliation/json --- payload]]]></file:content>
    </file:write>

NEW QUESTION # 42

There are three routes configured for Scatter-Gather and incoming event has a payload is an Array of three objects. How routing will take place in this scenario?

- A. Incoming array objects would be split into three and each part would be sent to one route each in parallel
- B. Entire event would be sent to each route in parallel
- C. Entire event would be sent to each route sequentially
- D. Incoming array objects would be split into three and each part would be sent to one route each in sequential manner

Answer: B

Explanation:

Entire event would be sent to each route in parallel.

Scatter-Gather works as follows :

- The Scatter-Gather component receives a Mule event and sends a reference of this Mule event to each processing route.

- Each of the processing routes starts executing in parallel. After all processors inside a route finish processing, the route returns a Mule event, which can be either the same Mule event without modifications or a new Mule event created by the processors in the route as a result of the modifications applied.

- After all processing routes have finished execution, the Scatter-Gather component creates a new Mule event that combines all resulting Mule events from each route, and then passes the new Mule event to the next component in the flow.
