Our approach to Salesforce Platform-App-Builder Exam Preparation is focused on quality over quantity, which means our Salesforce Platform-App-Builder practice tests help you identify the most important concepts and skills you need to master to pass the exam. We also provide ongoing 24/7 support to help you stay on track while using our product.

Salesforce Platform-App-Builder (Salesforce Certified Platform App Builder) exam is a certification that validates an individual's knowledge and skills in building custom applications using the Salesforce platform. The Salesforce Platform is a cloud-based platform that allows users to create and manage applications without the need for hardware or software installation. With the Salesforce Platform, users can build custom applications that fit their specific business needs, automate workflows, and integrate with other systems.

Salesforce Platform-App-Builder (Salesforce Certified Platform App Builder) Certification Exam is a credential that validates a professional's knowledge and competency in building custom applications on the Salesforce platform. Salesforce Certified Platform App Builder certification is designed for individuals who have a solid understanding of Salesforce's declarative capabilities and are able to design, build, and implement custom applications that are scalable, secure, and maintainable. Salesforce Certified Platform App Builder certification exam covers a wide range of topics, including data modeling, security, user interface design, business logic, and reporting.

100% Pass Quiz Platform-App-Builder - Salesforce Certified Platform App Builder –Reliable Questions Exam

Our website is a leading dumps provider worldwide that offers the latest valid test questions and answers for certification test, especially for Salesforce practice test. We paid great attention to the study of Platform-App-Builder vce braindumps for many years and are specialized in the questions of actual test. You can find everything that you need to pass test in our Platform-App-Builder learning materials.

The Salesforce Platform-App-Builder Exam covers a range of topics, including data modeling, security, user interface design, business logic, and workflow automation. The Salesforce Platform-App-Builder Exam is ideal for professionals who are interested in becoming certified in building custom applications on the Salesforce platform, including developers, administrators, and consultants.

Salesforce Certified Platform App Builder Sample Questions (Q245-Q250):

NEW QUESTION # 245

Universal Containers has created two custom objects called Seminars and Attendees. Organization-wide defaults for those objects have been set to private. Universal Containers wants to set up a new junction object between these objects. A select group of users should be able to edit records in the junction object.

Which two steps should an app builder take to configure the proper security?

- **A. Create an owner-based sharing rule that gives Read access to the junction object.**
- B. Create owner-based sharing rules that give Read access to the master objects.
- C. Set lookup filters on both junction object relationship fields.
- **D. Set Sharing Settings to Read Only on both master-detail relationship fields.**

Answer: A,D

NEW QUESTION # 246

When a sales rep submits an account for approval, Universal Containers wants the user to answer additional questions via a popup window to populate additional record fields.

What should an app builder use to achieve the desired result?

- **A. Custom button and Flow**
- B. Custom picklist field and Process Builder
- C. Lightning component and Process Builder
- D. Process Builder and Flow

Answer: A

Explanation:

The app builder should use a custom button and Flow to achieve the desired result. A custom button is a button that can invoke custom logic or actions when clicked by a user. A Flow is a type of automation tool that can guide users through a series of screens and perform actions based on user input. In this case, the app builder can create a custom button on the Account object that launches a Flow when clicked by a user. The Flow can display a popup window with questions for the user to answer and populate additional fields on the Account record based on the user input. Option A, B, and C are not tools that can achieve this result.

NEW QUESTION # 247

What can be branded in SF1?(Select 3)

- A. Action tab bar
- **B. Loading page color**
- **C. Header and Search**
- **D. Loading logo**

Answer: B,C,D

NEW QUESTION # 248

Cloud Kicks is redefining its entire business process to convert the Manager Notes field from a long text area field. The goal is to encourage managers to be more concise in their comments and stay at 255 characters or less. There is preexisting information in the Manager Notes field that often is well beyond the character limit.

What would happen to any existing information if the app builder tries to convert a preexisting long text area field to text area?

- **A. Preexisting information will truncate to the first 255 characters.**
- B. Preexisting information will remain even if it was over 255 characters.
- C. Preexisting information will cause an error message to pop up.
- D. Preexisting information in the field will be completely lost.

Answer: A

NEW QUESTION # 249

Universal Containers uses a custom picklist field Account Region on the Account record. They want this region to be reflected on all related contact records and stay in sync if the value of this field changes on the Account. How should an app builder meet this requirement?

- A. Create a formula field on the Contact object > Set the value of the formula to TEXT (Account.Account_Region_e).
- B. Create a picklist field called ' Account Region ' on Contact object > Create a Lookup Relationship to Update this field if the Account Region field on the Account is change
- C. Create a formula field on the Contact object > Set the value of the formula to ISPICKVAL (Account.Account_Region_o).
- D. Create a text field called ' Account Region ' on Contact object > Create a Lookup Relationship to Update this field if the Account Region field on the Account is change

Answer: A

Explanation:

The answer is controlled by runtime behavior, not by naming similarity. Formula and validation expressions must respect Salesforce data types. Picklists require picklist-aware handling, dates require date functions or date arithmetic, and image or text formulas must return the correct type. The correct response is therefore D.

Create a formula field on the Contact object > Set the value of the formula to TEXT (Account.Account_Region_e).

The scenario is not asking for a feature list. It is asking which configuration produces the requested result with the fewest moving parts. A Salesforce app builder should favor a standard, visible Setup configuration whenever it fully meets the business need. That approach makes the build easier to validate in sandbox and easier to explain during release review.

The other options fall short for clear platform reasons. A (Create a picklist field called ' Account Region ' on Contact object > Create a Lookup Relationship to Update this field if the Account Region field on the Account is change) is not enough: A lookup relationship is more loosely coupled and does not provide every master-detail behavior, especially native roll-up behavior. B (Create a formula field on the Contact object > Set the value of the formula to ISPICKVAL (Account.Account_Region_o).) handles a different concern; A formula is calculated display logic and cannot always store static values or perform record updates. C (Create a text field called ' Account Region ' on Contact object > Create a Lookup Relationship to Update this field if the Account Region field on the Account is change) is less defensible because A lookup relationship is more loosely coupled and does not provide every master-detail behavior, especially native roll-up behavior. Before release, test the configuration with the affected profile and realistic records, not only with a system administrator account.
