

# Test EC-COUNCIL 312-38 Vce Free | 312-38 Exam Tutorials

2026 Latest Exam4Tests 312-38 PDF Dumps and 312-38 Exam Engine Free Share: [https://drive.google.com/open?id=1jzPvH8e484wNHMmPRaIVc\\_VkA8zXL7iD](https://drive.google.com/open?id=1jzPvH8e484wNHMmPRaIVc_VkA8zXL7iD)

As you know, getting a 312-38 certificate is helpful to your career development. At the same time, investing money on improving yourself is sensible. You need to be responsible for your life. Stop wasting your time on meaningless things. We sincerely hope that you can choose our 312-38 Study Guide, which may change your life and career by just a step with according 312-38 certification. For we have helped so many customers achieve their dreams.

To earn the EC-COUNCIL 312-38 certification, individuals need to pass the certification exam. 312-38 exam is a comprehensive assessment of an individual's knowledge and skills in network security and defense. 312-38 exam consists of 100 multiple-choice questions and has a time limit of four hours. Individuals who pass the exam are awarded the EC-COUNCIL 312-38 Certification, which is valid for three years. EC-Council Certified Network Defender CND certification is a testament to an individual's commitment to network security and defense and showcases their expertise in the field.

## 312-38 Exam Tutorials & Test 312-38 Dump

Are you ready to accept this challenge and want to crack the EC-Council Certified Network Defender CND 312-38 certification exam? If your answer is yes then just get register for the 312-38 test and start preparation with Exam4Tests 312-38 PDF Questions and practice test software. All three 312-38 exam dumps formats are ready for download. Just download EC-Council Certified Network Defender CND 312-38 exam questions and start preparation right now.

## EC-COUNCIL EC-Council Certified Network Defender CND Sample Questions (Q640-Q645):

### NEW QUESTION # 640

The SNMP contains various commands that reduce the burden on the network administrators.

Which of the following commands is used by SNMP agents to notify SNMP managers about an event occurring in the network?

- A. SET
- B. INFORM
- C. TRAPS
- D. RESPONSE

**Answer: C**

Explanation:

In SNMP (Simple Network Management Protocol), the TRAPS command is used by SNMP agents to notify SNMP managers about certain events occurring within the network. TRAPS are unsolicited messages sent from an SNMP agent to the SNMP manager, alerting it of a significant event, such as a system reboot, link failure, or high CPU usage<sup>1</sup>. Unlike INFORM requests, which are acknowledged messages ensuring that the notification was received, TRAPS do not require an acknowledgment from the SNMP manager, making them less reliable but faster and more suitable for alerting in real-time scenarios<sup>2</sup>.

#### NEW QUESTION # 641

Which of the following statements are TRUE about Demilitarized zone (DMZ)? Each correct answer represents a complete solution. Choose all that apply.

- A. In a DMZ configuration, most computers on the LAN run behind a firewall connected to a public network like the Internet.
- B. Hosts in the DMZ have full connectivity to specific hosts in the internal network.
- C. Demilitarized zone is a physical or logical sub-network that contains and exposes external services of an organization to a larger un-trusted network.
- D. The purpose of a DMZ is to add an additional layer of security to the Local Area Network of an organization.

**Answer: A,C,D**

Explanation:

A demilitarized zone (DMZ) is a physical or logical subnetwork that contains and exposes external services of an organization to a larger network, usually the Internet. The purpose of a DMZ is to add an additional layer of security to an organization's Local Area Network (LAN); an external attacker only has access to equipment in the DMZ, rather than the whole of the network. Hosts in the DMZ have limited connectivity to specific hosts in the internal network, though communication with other hosts in the DMZ and to the external network is allowed. This allows hosts in the DMZ to provide services to both the internal and external networks, while an intervening firewall controls the traffic between the DMZ servers and the internal network clients. In a DMZ configuration, most computers on the LAN run behind a firewall connected to a public network such as the Internet.

#### NEW QUESTION # 642

Tom works as a network administrator in a multinational organization having branches across North America and Europe. Tom wants to implement a storage technology that can provide centralized data storage and provide free data backup on the server. He should be able to perform data backup and recovery more efficiently with the selected technology. Which of the following storage technologies best suits Tom's requirements?

- A. DAS
- B. RAID
- C. NAS
- D. PAS

**Answer: C**

#### NEW QUESTION # 643

Which of the following is an intrusion detection system that reads all incoming packets and tries to find suspicious patterns known as signatures or rules?

- A. DMZ
- B. NIDS
- C. IPS

- D. HIDS

**Answer: B**

Explanation:

A network intrusion detection system (NIDS) is an intrusion detection system that tries to detect malicious activity such as denial of service attacks, port scans or even attempts to crack into computers by monitoring network traffic. A NIDS reads all the incoming packets and tries to find suspicious patterns known as signatures or rules. It also tries to detect incoming shell codes in the same manner that an ordinary intrusion detection system does.

Answer option A is incorrect. A host-based intrusion detection system (HIDS) produces a false alarm because of the abnormal behavior of users and the network. A host-based intrusion detection system (HIDS) is an intrusion detection system that monitors and analyses the internals of a computing system rather than the network packets on its external interfaces. A host-based Intrusion Detection System (HIDS) monitors all or parts of the dynamic behavior and the state of a computer system. HIDS looks at the state of a system, its stored information, whether in RAM, in the file system, log files or elsewhere; and checks that the contents of these appear as expected. Answer option B is incorrect. An intrusion prevention system (IPS) is a network security device that monitors network and/or system activities for malicious or unwanted behavior and can react, in real-time, to block or prevent those activities. When an attack is detected, it can drop the offending packets while still allowing all other traffic to pass.

Answer option C is incorrect. A demilitarized zone (DMZ) is a physical or logical subnetwork that contains and exposes external services of an organization to a larger network, usually the Internet. The purpose of a DMZ is to add an additional layer of security to an organization's Local Area Network (LAN); an external attacker only has access to equipment in the DMZ, rather than the whole of the network. Hosts in the DMZ have limited connectivity to specific hosts in the internal network, though communication with other hosts in the DMZ and to the external network is allowed. This allows hosts in the DMZ to provide services to both the internal and external networks, while an intervening firewall controls the traffic between the DMZ servers and the internal network clients. In a DMZ configuration, most computers on the LAN run behind a firewall connected to a public network such as the Internet.

#### **NEW QUESTION # 644**

Which of the following is a mechanism that helps in ensuring that only the intended and authorized recipients are able to read data?

- A. Integrity
- **B. Confidentiality**
- C. Authentication
- D. Data availability

**Answer: B**

Explanation:

Confidentiality is a mechanism that ensures that only the intended and authorized recipients are able to read data. The data is so encrypted that even if an unauthorized user gets access to it, he will not get any meaning out of it.

Answer option A is incorrect. In information security, integrity means that data cannot be modified without authorization. This is not the same thing as referential integrity in databases. Integrity is violated when an employee accidentally or with malicious intent deletes important data files, when a computer virus infects a computer, when an employee is able to modify his own salary in a payroll database, when an unauthorized user vandalizes a web site, when someone is able to cast a very large number of votes in an online poll, and so on. There are many ways in which integrity could be violated without malicious intent. In the simplest case, a user on a system could mistype someone's address. On a larger scale, if an automated process is not written and tested correctly, bulk updates to a database could alter data in an incorrect way, leaving the integrity of the data compromised. Information security professionals are tasked with finding ways to implement controls that prevent errors of integrity.

Answer option B is incorrect. Data availability is one of the security principles that ensures that the data and communication services will be available for use when needed (expected). It is a method of describing products and services availability by which it is ensured that data continues to be available at a required level of performance in situations ranging from normal to disastrous. Data availability is achieved through redundancy, which depends upon where the data is stored and how it can be reached.

Answer option D is incorrect. Authentication is the act of establishing or confirming something (or someone) as authentic, i.e., the claims made by or about the subject are true ("authentication" is a variant of this word).

## NEW QUESTION # 645

.....

Applicants of the 312-38 test who invest the time, effort, and preparation with updated 312-38 questions eventually get success. Without the latest EC-Council Certified Network Defender CND (312-38) exam dumps, candidates fail the test and waste their time and money. As a result, preparing with actual 312-38 Questions is essential to clear the test.
