Candidates all around the globe use their full potential only to get ISQI CTFL\_Syll\_4.0 certification. Once the candidate is a ISQI certified, he gets multiple good career opportunities in the ISQI sector. To pass the CTFL\_Syll\_4.0 Certification Exam a candidate needs to be updated and reliable ISTQB Certified Tester Foundation Level (CTFL) v4.0 (CTFL\_Syll\_4.0) prep material.

## **ISQI ISTQB Certified Tester Foundation Level (CTFL) v4.0 Sample Questions (Q183-Q188):**

**NEW QUESTION # 183**

Which ONE of the following options BEST describes a key characteristic of non-functional testing?

- A. Limiting non-functional testing to security testing and performance testing only.
- **B. Performing non-functional testing starting at the system test level.**
- C. Ensuring non-functional testing focuses only on user experience and usability.
- D. Conducting non-functional testing exclusively at the acceptance test level.

**Answer: B**

Explanation:

Non-functional testing evaluates attributes like performance, security, and usability, which are typically assessed at the system test level or higher (A). It is not restricted to acceptance testing (B), goes beyond security and performance testing (C), and covers more than just user experience (D).

Reference: ISTQB CTFL v4.0 Syllabus, Section 2.2.2 - Non-functional Testing

#### NEW QUESTION # 184

Which of the following is a good testing practice which is applicable INDEPENDENT of the software development lifecycle followed?

- A. Reviews should be done after the work products have been finalized
- B. Large amount of redundancy between test levels is good because it prevents bug leakage
- C. Not all development activities should have corresponding test activities
- **D. Each test level should have an appropriate test objective**

**Answer: D**

Explanation:

Independent of the software development lifecycle followed, it is a good practice to ensure that each test level (e.g., unit testing, integration testing, system testing) has clear and appropriate objectives. This ensures that the testing is focused and effective at each level. Other options either contradict good practices or are not applicable across all lifecycle models.

References:

\* ISTQB CTFL Syllabus V4.0, Section 1.4.1 on test levels and objectives, emphasizing the importance of defining clear test objectives for each level of testing.

#### NEW QUESTION # 185

Which of the following is a test-first approach, where tests that express a shared understanding from stakeholders of how the application is expected to work, are first written in business-readable language (following the Given/When/Then format), and then made executable to drive development?

- A. Acceptance Test-Driven Development (ATDD)
- B. Test-Driven Development (TDD)
- C. Domain-Driven Design (DDD)
- **D. Behavior-Driven Development (BDD)**

**Answer: D**

Explanation:

This answer is correct because Behavior-Driven Development (BDD) is a test-first approach, where tests that express a shared understanding from stakeholders of how the application is expected to work, are first written in business-readable language (following the Given/When/Then format), and then made executable to drive development. BDD is a collaborative approach that involves testers, developers, business analysts, product owners, and other stakeholders in defining the expected behavior of the application using scenarios that describe the preconditions, actions, and outcomes of the application. BDD scenarios are written using a domain-specific language (DSL) that can be translated into executable test cases using tools such as Cucumber or SpecFlow. BDD aims to improve communication, collaboration, and feedback among the team members, and to deliver software that meets the customer's needs and expectations. References: ISTQB Glossary of Testing Terms v4.0, ISTQB Foundation Level Syllabus v4.0, Section 3.1.1.4

#### NEW QUESTION # 186

The whole-team approach:

- A. is a consensus-based approach that engages the whole team in estimating the user stories
- **B. promotes the idea that all team members should be responsible for the quality of the product**
- C. is mostly adopted in projects aimed at developing safety-critical systems, as it ensures the highest level of testing independence
- D. promotes the idea that all team members should have a thorough understanding of test techniques

**Answer: B**

Explanation:

This answer is correct because the whole-team approach is a way of working in agile projects where all team members share the responsibility for the quality of the product, and collaborate on delivering value to the customer. The whole-team approach involves testers, developers, business analysts, product owners, and other stakeholders in planning, designing, developing, testing, and delivering the product. The whole-team approach fosters communication, feedback, learning, and continuous improvement within the team. Reference: ISTQB Glossary of Testing Terms v4.0, ISTQB Foundation Level Syllabus v4.0, Section 3.1.1.1

#### **NEW QUESTION # 187**

Which of the following lists factors That contribute to PROJECT risks?

- **A. skill and staff shortages; problems in defining the right requirements, contractual issues.**
- B. problems in defining the right requirements; contractual issues; poor software quality characteristics.
- C. skill and staff shortages; software does not perform its intended functions; problems in defining the right requirements.
- D. poor software quality characteristics; software does not perform its intended functions.

**Answer: A**

Explanation:

Project risks are the uncertainties or threats that may affect the project objectives, such as scope, schedule, cost, and quality. According to the ISTQB Certified Tester Foundation Level (CTFL) v4.0 syllabus, some of the factors that contribute to project risks are:

\* Skill and staff shortages: This factor refers to the lack of adequate or qualified human resources to perform the project tasks. This may result in delays, errors, rework, or low productivity.

\* Problems in defining the right requirements: This factor refers to the difficulties or ambiguities in eliciting, analyzing, specifying, validating, or managing the requirements of the project. This may result in misalignment, inconsistencies, gaps, or changes in the requirements, affecting the project scope and quality.

\* Contractual issues: This factor refers to the challenges or disputes that may arise from the contractual agreements between the project parties, such as clients, suppliers, vendors, or subcontractors. This may result in legal, financial, or ethical risks, affecting the project delivery and satisfaction.

The other options are not correct because they list factors that contribute to PRODUCT risks, not project risks. Product risks are the uncertainties or threats that may affect the quality or functionality of the software product or system. Some of the factors that contribute to product risks are:

\* Poor software quality characteristics: This factor refers to the lack of adherence or compliance to the quality attributes or criteria of the software product or system, such as reliability, usability, security, performance, or maintainability. This may result in defects, failures, or dissatisfaction of the users or stakeholders.

\* Software does not perform its intended functions: This factor refers to the deviation or discrepancy between the expected and actual behavior or output of the software product or system. This may result in errors, faults, or malfunctions of the software product or system.
