## Reliable Identity-and-Access-Management-Architect Braindumps Free - Test Identity-and-Access-Management-Architect Pattern

As we all know, if everyone keeps doing one thing for a long time, as time goes on, people's attention will go from rising to falling. Experiments have shown that this is scientifically based and that our attention can only play the best role in a single period of time. The Identity-and-Access-Management-Architect test material is professional editorial team, each test product layout and content of proofreading are conducted by experienced professionals who have many years of rich teaching experiences, so by the editor of fine typesetting and strict check, the latest Identity-and-Access-Management-Architect Exam Torrent is presented to each user's page is refreshing, but also ensures the accuracy of all kinds of learning materials is extremely high.

Salesforce Certified Identity and Access Management Architect certification is ideal for professionals who want to deepen their understanding of Salesforce's identity and access management solutions, and apply their knowledge to help organizations build secure and scalable systems. Identity-and-Access-Management-Architect Exam covers a wide range of topics, including identity and access management models, user authentication and authorization, data security, and compliance.

## Salesforce Certified Identity and Access Management Architect Sample Questions (Q30-Q35):

### NEW QUESTION # 30

Universal Containers (UC) is using Active Directory as its corporate identity provider and Salesforce as its CRM for customer care agents, who use SAML based sign-on to login to Salesforce. The default agent profile does not include the Manage User permission. UC wants to dynamically update the agent role and permission sets.

Which two mechanisms are used to provision agents with the appropriate permissions?

Choose 2 answers

- A. Use SAML Just-in-Time (JIT) Handler class run as current user to update role and permission sets.
- B. Use SAML Just-in-Time (JIT) handler class run as an admin user to update role and permission sets.
- C. Use Login Flow in System Context to update role and permission sets.
- D. Use Login Flow in User Context to update role and permission sets.

**Answer: B,C**

Explanation:

To dynamically update the agent role and permission sets using Active Directory as the corporate identity provider and Salesforce as the CRM for customer care agents, who use SAML based sign-on to login to Salesforce, the identity architect should use two mechanisms:

\* Use Login Flow in System Context to update role and permission sets. A Login Flow is a custom post-authentication process that can be used to add additional screens or logic after a user logs in to Salesforce. A System Context is a mode that allows a LoginFlow to run as an administrator user with full access to Salesforce data and metadata. By using a Login Flow in System Context, the identity architect can update the agent role and permission sets based on the information from Active Directory or other criteria.

\* Use SAML Just-in-Time (JIT) handler class run as an admin user to update role and permission sets. A SAML JIT handler class is a class that implements the Auth.SamlJitHandler interface and defines how to handle SAML assertions for Just-in-Time (JIT) provisioning. JIT provisioning is a feature that allows Salesforce to create or update user records on the fly when users log in through an external identity provider. By using a SAML JIT handler class run as an admin user, the identity architect can update the agent role and permission sets based on the information from the SAML assertion. References: Login Flows, SAML Just-in-Time Provisioning, Auth.SamlJitHandler Interface

### NEW QUESTION # 31

Universal Containers (UC) has an existing e-commerce platform and is implementing a new customer community. They do not want to force customers to register on both applications due to concern over the customers experience. It is expected that 25% of the e-commerce customers will utilize the customer community. The e-commerce platform is capable of generating SAML responses and has an existing RESTful API capable of managing users. How should UC create the identities of its e-commerce users with the customer community?

- A. Use SAML JIT in the Customer Community to create users when a user tries to login to the community from the e-commerce site.
- B. Use the e-commerce REST API to create users when a user self-register on the customer community and use SAML to allow SSO.
- C. Use a nightly batch ETL job to sync users between the Customer Community and the e-commerce platform and use SAML to allow SSO.
- D. Use the standard Salesforce API to create users in the Community When a User is Created in the e-Commerce platform and use SAML to allow SSO.

**Answer: A**

### NEW QUESTION # 32

Northern Trail Outfitters (NTO) uses the Customer 360 Platform implemented on Salesforce Experience Cloud. The development team in charge has learned of a contactless user feature, which can reduce the overhead of managing customers and partners by creating users without contact information.

What is the potential impact to the architecture if NTO decides to implement this feature?

- A. Contactless user feature is available only with the External Identity license, which can restrict the Experience Cloud functionality available to the user.
- B. Custom registration handler is needed to correctly assign External Identity or Community license for the newly registered contactless user.
- C. Passwordless authentication cannot be supported because the mobile phone receiving one-time password (OTP) needs to

match the number on the contact record.

- **D. If contactless user is upgraded to Community license, the contact record is automatically created and linked to the user record, but not associated with an Account.**

**Answer: D**

Explanation:

Explanation

According to the Salesforce documentation<sup>3</sup>, contactless user feature allows creating users without contact information, such as email address or phone number. This reduces the overhead of managing customers and partners who don't need or want to provide their contact information. However, if a contactless user is upgraded to a Community license, a contact record is automatically created and linked to the user record, but not associated with an account. This can impact the architecture of NTO's Customer 360 Platform, as they may need to associate contacts with accounts for reporting or other purposes.

### NEW QUESTION # 33

Universal Containers (UC) wants its closed Won opportunities to be synced to a Data Warehouse in near real time. UC has implemented Outbound Message to enable near real-time data sync. UC wants to ensure that communication between Salesforce and Target System is Secure. What Certificate is sent along with the Outbound Message?

- A. The default Client Certificate or a Certificate from Certificate and Key Management menu.
- B. The CA-Signed Certificate from the Certificate and Key Management menu.
- C. The Self-Signed Certificates from the Certificate & Key Management menu.
- **D. The default Client Certificate from the Develop--> API Menu.**

**Answer: D**

### NEW QUESTION # 34

How should an Architect automatically redirect users to the login page of the external Identity provider when using an SP-Initiated SAML flow with Salesforce as a Service Provider?

- A. Remove the Login page from the list of Authentication Services on the My Domain configuration.
- B. Enable the Redirect to the Identity Provider setting under Authentication Services on the My domain Configuration.
- C. Use visualforce as the landing page for My Domain to redirect users to the Identity Provider login Page.
- **D. Set the Identity Provider as default and enable the Redirect to the Identity Provider setting on the SAML Configuration.**

**Answer: D**

Explanation:

Setting the IdentityProvider as default and enabling the Redirect to the Identity Provider setting on the SAML Configuration will automatically redirect users to the login page of the external Identity Provider when using an SP-Initiated SAML flow with Salesforce as a ServiceProvider<sup>1</sup>. Option A is incorrect because Visualforce is not a supported method for redirecting users to the Identity Provider login page<sup>2</sup>. Option B is incorrect because enabling the Redirect to the Identity Provider setting under Authentication Services on the My Domain Configuration will only redirect users to the Identity Provider login page when using an IdP-Initiated SAML flow<sup>3</sup>. Option C is incorrect because removing the Login page from the list of Authentication Services on the My Domain configuration will not affect the SP-Initiated SAML flow, and may cause other issues with authentication<sup>4</sup>.
