### 問題 #27

A platform architect includes both an API gateway and a service mesh in the architecture of a distributed application for communication management.

Which type of communication management does a service mesh typically perform in this architecture?

- A. Between application services and the firewall
- **B. Between services within the application**
- C. Between the application and external API implementations
- D. Between the application and external API clients

答案： B

解題說明：

A service mesh is typically used to manage communication between microservices within a distributed application. Here's a detailed

explanation:

\* Service Mesh:

\* Definition: A service mesh is a dedicated infrastructure layer that manages service-to-service communication within a microservices architecture.

\* Features: Provides features such as load balancing, service discovery, traffic management, and security (e.g., mutual TLS).

\* Intra-Application Communication:

\* Focus: It focuses on internal communication between microservices, ensuring reliability, security, and observability of inter-service communications.

\* Management: Handles retries, circuit breaking, and service-to-service authentication transparently.

\* API Gateway:

\* Complementary Role: While a service mesh manages internal microservice communications, an API gateway manages external client requests and provides a single entry point for external API clients.

### 問題 #28

A Kubernetes controller automatically adds another pod replica to the resource pool in response to increased application load. Which scalability option is the controller implementing?

- A. Vertical
- **B. Horizontal**
- C. Down
- D. Diagonal

答案: **B**

解題說明:

Kubernetes offers several scalability options to handle varying application loads. The scenario described involves adding another pod replica in response to increased load, which is a form of horizontal scaling. Here's a detailed explanation:

\* Horizontal Scaling:

\* Definition: Horizontal scaling, also known as scaling out, involves adding more instances (pods) to distribute the load and increase capacity.

\* Implementation in Kubernetes: Kubernetes uses controllers like the Horizontal Pod Autoscaler (HPA) to automatically adjust the number of pod replicas based on observed CPU utilization or other select metrics.

\* Benefits:

\* Load Distribution: By adding more pod replicas, the load is evenly distributed, reducing the risk of any single pod being overwhelmed.

\* Fault Tolerance: Horizontal scaling enhances fault tolerance and availability, as multiple pod replicas can handle requests if one fails.

\* Automatic Scaling:

\* Kubernetes Controller: The HPA continuously monitors the application load and adjusts the number of pod replicas accordingly, ensuring optimal performance.

### 問題 #29

CloudHub is an example of which cloud computing service model?

- A. Infrastructure as a Service (IaaS)
- B. Software as a Service (SaaS)
- C. Monitoring as a Service (MaaS)
- **D. Platform as a Service (PaaS)**

答案: **D**

解題說明:

CloudHub is MuleSoft's integration platform as a service (iPaaS) offering. It provides a platform for deploying and managing

integration applications in the cloud. Here's a detailed explanation:

- \* Platform as a Service (PaaS):
- \* Definition: PaaS provides a cloud-based environment with everything required to support the complete lifecycle of building and deploying web applications and services without the complexity of managing the underlying hardware and software layers.
- \* CloudHub Features:
- \* Deployment: Simplifies the deployment of Mule applications to the cloud.
- \* Management: Provides tools for managing application performance, scaling, and monitoring.
- \* Connectivity: Offers out-of-the-box connectors and integration capabilities for various systems and services.
- \* Benefits:
- \* Scalability: Automatically scales applications based on demand.
- \* Availability: Ensures high availability and reliability with built-in disaster recovery and failover capabilities.
- \* Security: Provides robust security features to protect data and applications.

### 問題 #30

According to MuleSoft which deployment characteristic applies to a microservices application architecture?

- A. Services exist as independent deployment artifacts and can be scaled independently of other services
- B. A deployment to enhance one capability requires a redeployment of all capabilities
- C. Core business capabilities are encapsulated in a single deployable application
- D. All services of an application can be deployed together as single Java WAR file

答案： A

解題說明：

Microservices architecture is designed to enhance flexibility, scalability, and maintainability by decomposing applications into small, independent services. Here's a detailed explanation:

- \* Independent Deployment:
- \* Definition: Each microservice is developed, deployed, and managed independently. This allows teams to work on different services without interfering with each other.
- \* Scalability: Services can be scaled independently based on demand, improving resource utilization and system resilience.
- \* Benefits:
- \* Flexibility: Enhances the ability to update or scale specific parts of an application without affecting the whole system.
- \* Resilience: Isolates failures to individual services, preventing cascading failures across the entire application.
- \* Technology Diversity: Allows the use of different technologies and languages best suited for each service.

### 問題 #31

A high-volume eCommerce retailer receives thousands of orders per hour and requires notification of its order management warehouse, and billing systems for subsequent processing within 15 minutes of order submission through its website Which integration technology, when used for its typical and intended purpose, meets the retailer's requirements for this use case?

- A. Managed File Transfer (MFT)
- B. EnterpriseData Warehouse (EDW)
- C. Publish/Subscribe Messaging Bus (Pub/Sub)
- D. Extract Transform Load (ETL)

答案： C

解題說明：

For a high-volume eCommerce retailer requiring real-time or near-real-time notifications to multiple systems, a Publish/Subscribe Messaging Bus is an ideal choice. Here's a detailed explanation:

- \* Publish/Subscribe Model:
- \* Definition: The Pub/Sub messaging model allows messages to be sent (published) by producers and received (subscribed to) by multiple consumers.

- \* Asynchronous Communication: It decouples the sender and receiver, enabling asynchronous communication.
  - \* Use Case Fit:
  - \* Real-Time Processing: Suitable for scenarios requiring real-time or near-real-time data processing and notification.
  - \* Scalability: Handles high volumes of messages efficiently, making it suitable for environments with thousands of transactions per hour.
  - \* Implementation:
  - \* Message Broker: A message broker (e.g., Apache Kafka, RabbitMQ) can manage the distribution of messages to the order management, warehouse, and billing systems.
  - \* Guaranteed Delivery: Ensures that messages are reliably delivered to all subscribed systems within the required time frame.
