**Answer: C**

Explanation:

Paths

The path of an HTTP listener can be static, which requires exact matches, or feature placeholders. Placeholders can be wildcards (\*), which match against anything they are compared to, or parameters ({param}), which not only match against anything but also capture those values on a URI parameters map.

Take the following example paths for three listeners using a configuration that establishes api/v1 as the base path:

account/mulesoft/main-contact: only match the exact path request `http://awesome-company.com/api/v1/account/mulesoft/main-contact`

account/{accountId}/main-contact: matches all path requests structured similarly, such as `http://awesome-company.com/api/v1/account/salesforce/main-contact`, and save salesforce as the value of accountId.

account/{accountId}/\*: matches all path requests different from main-contact, such as `http://awesome-company.com/api/v1/account/mulesoft/users`, and save mulesoft as the value of accountId.
