CompTIA Server+ Certification Exam Sample Questions (Q148-Q153):

NEW QUESTION # 148

Which of the following BEST describes overprovisioning in a virtual server environment?

- A. Installing more physical hardware than is necessary to run the virtual environment to allow for future expansion
- B. Ensuring there are enough physical resources to sustain the complete virtual environment in the event of a host failure
- C. Allowing a virtual machine to utilize more resources than are allocated to it based on the server load
- **D. Committing more virtual resources to virtual machines than there are physical resources present**

Answer: D

Explanation:

Explanation

This is the best definition of overprovisioning in a virtual server environment because it means allocating more CPU, memory, disk, or network resources to the virtual machines than what is actually available on the physical host. This can lead to performance issues and resource contention.

NEW QUESTION # 149

A company created a new DR plan. The management team would like to begin performing a review of this plan without endangering company data and with a minimal time commitment. Which of the following testing methods would best allow for this type of review?

- A. Non-production
- B. Simulated
- C. Live
- **D. Tabletop**

Answer: D

Explanation:

Tabletop testing is a method of reviewing a DR plan without endangering company data and with a minimal time commitment.

Tabletop testing involves a simulated scenario where the participants discuss their roles and responsibilities, identify potential issues, and evaluate the effectiveness of the plan. Simulated, live, and non-production testing are methods that involve more time and resources, and may pose some risks to company data. NEW QUESTION # 150

A technician is installing a variety of servers in a rack. Which of the following is the BEST course of action for the technician to take while loading the rack?

- A. Place a UPS at the top of the rack
- **B. Install the heaviest server at the bottom of the rack**
- C. Alternate the direction of the airflow
- D. Leave 1U of space between each server

Answer: B

Explanation:

Explanation

The technician should install the heaviest server at the bottom of the rack to load the rack properly. Installing the heaviest server at the bottom of the rack helps to balance the weight distribution and prevent the rack from tipping over or collapsing. Installing the heaviest server at the bottom of the rack also makes it easier to access and service the server without lifting or moving it. Installing the heaviest server at any other position in the rack could create instability and safety hazards.

NEW QUESTION # 151

A technician is connecting a Linux server to a share on a NAS. Which of the following is the MOST appropriate native protocol to use for this task?

- A. FTP
- B. NFS

- C. CIFS
- D. SFTP

Answer: C

NEW QUESTION # 152

A server administrator is experiencing difficulty configuring MySQL on a Linux server. The administrator issues the `getenforce` command and receives the following output:

```
># Enforcing
```

Which of the following commands should the administrator issue to configure MySQL successfully?

- A. `setenforce 1`
- B. `setenforce permissive`
- C. `setenforce 0`
- D. `setenforce disabled`

Answer: C

Explanation:

The command that the administrator should issue to configure MySQL successfully is `setenforce 0`. This command sets the SELinux (Security-Enhanced Linux) mode to permissive, which means that SELinux will not enforce its security policies and will only log any violations. SELinux is a feature that provides mandatory access control (MAC) for Linux systems, which can enhance the security and prevent unauthorized access or modification of files and processes. However, SELinux can also interfere with some applications or services that require specific permissions or ports that are not allowed by SELinux by default. In this case, MySQL may not be able to run properly due to SELinux restrictions. To resolve this issue, the administrator can either disable SELinux temporarily by using `setenforce 0`, or permanently by editing the `/etc/selinux/config` file and setting `SELINUX=disabled`. Alternatively, the administrator can configure SELinux to allow MySQL to run by using commands such as `semanage` or `setsebool`.
