Fortinet FCSS - Enterprise Firewall 7.4 Administrator 認定 FCSS_EFW_AD-7.4 試験問題 (Q42-Q47):

質問 # 42

In which order are firewall policies processed on a FortiGate unit?

- A. Based on the priority value.
- B. Based on best match.
- C. From top to down, according with their sequence number.
- D. From top to down, according with their policy ID number.

正解: C

質問 # 43

Which security feature is most commonly enabled on DCFW firewalls to protect servers in a data center?

- A. IPS
- B. Antivirus
- C. Web filtering
- D. Application control

正解: A

質問 # 44

An administrator needs to install an IPS profile without triggering false positives that can impact applications and cause problems with the user's normal traffic flow.

Which action can the administrator take to prevent false positives on IPS analysis?

- A. Use the IPS profile extension to select an operating system, protocol, and application for all the network internal services and users to prevent false positives.
- B. Install missing or expired SSUTLS certificates on the client PC to prevent expected false positives.
- C. Enable Scan Outgoing Connections to avoid clicking suspicious links or attachments that can deliver botnet malware and create false positives.

- D. Use an IPS profile with action monitor, however, the administrator must be aware that this can compromise network integrity.

正解: A

解説:

False positives in Intrusion Prevention System (IPS) analysis can disrupt legitimate traffic and negatively impact user experience. To reduce false positives while maintaining security, administrators can:

#Use IPS profile extensions to fine-tune the settings based on the organization's environment.

#Select the correct operating system, protocol, and application type to ensure that IPS signatures match the network's actual traffic patterns, reducing false positives.

#Customize signature selection based on the network's specific services, filtering out unnecessary or irrelevant signatures.

質問 # 45

An administrator is setting up an ADVPN configuration and wants to ensure that peer IDs are not exposed during VPN establishment.

Which protocol can the administrator use to enhance security?

- A. Use IKEv2, which encrypts peer IDs and prevents exposure.
- B. Opt for SSL VPN web mode because it does not use peer IDs at all.
- C. Stick with IKEv1 main mode because it offers better performance.
- D. Choose IKEv1 aggressive mode because it simplifies peer identification.

正解: A

解説:

In ADVPN (Auto-Discovery VPN) configurations, security concerns include protecting peer IDs during VPN establishment. Peer IDs are exchanged in the IKE (Internet Key Exchange) negotiation phase, and their exposure could lead to privacy risks or targeted attacks.

#IKEv2 encrypts peer IDs, making it more secure compared to IKEv1, where peer IDs can be exposed in plaintext in aggressive mode.

#IKEv2 also provides better performance and flexibility while supporting dynamic tunnel establishment in ADVPN.

質問 # 46

A FortiGate device has the following LDAP configuration:

```
config user ldap
  edit "WindowsLDAP"
    set server "10.0.1.10"

    set type regular
    set username "cn=administrator, cn=users, dc=trainingAD, dc=training, dc=lab"
    set password xxxxx
  next
end
```

The LDAP user student cannot authenticate.

The exhibit shows the output of the authentication real time debug while testing the student account:
