SPLK-1002 Study Plan | Valid SPLK-1002 Exam Sample

You can trust DumpsFree SPLK-1002 exam questions and start this journey with complete peace of mind and satisfaction. The DumpsFree SPLK-1002 practice questions are designed and verified by experienced and qualified SPLK-1002 exam experts. They work collectively and put their expertise to ensure the top standard of DumpsFree Splunk SPLK-1002 Exam Dumps. So we can say that with the DumpsFree Splunk SPLK-1002 exam questions, you will get everything that you need to learn, prepare and pass the difficult Splunk Core Certified Power User Exam certification exam with good scores.

Splunk SPLK-1002 is a certification exam designed for professionals who want to demonstrate their expertise in using Splunk software. Splunk Core Certified Power User Exam certification is recognized globally and is highly valued by employers. SPLK-1002 Exam is intended to test the skills of the candidate in using Splunk software for data analysis and visualization.

Splunk Core Certified Power User Exam Sample Questions (Q182-Q187):

NEW QUESTION # 182
Which of the following is true about Pivot?

- A. Users must use SPL to find events in a Pivot.
- B. Users can save reports from Pivot.
- C. Users cannot create visualizations with Pivot.
- D. Users cannot share visualizations created with Pivot.

Answer: B

Explanation:
In Splunk, Pivot is a tool that allows you to report on a specific data set without using the Splunk Search Processing Language (SPL™)1. You can use a drag-and-drop interface to design and generate pivots that present different aspects of your data in the form of tables, charts, and other visualizations12.
One of the features of Pivot is that it allows you to save your reports1. This can be useful when you want to reuse a report or share it with others1. Therefore, it's not true that users cannot share visualizations created with Pivot or that they must use SPL to find events in a Pivot12. It's also not true that users cannot create visualizations with Pivot, as creating visualizations is one of the main functions of Pivot12.

NEW QUESTION # 183
What does the following search do?
index=condlog type=mysterymeat action=eaten I scats count as cornlog_count by us:

- A. Creates a table that groups the total number of users by vegetarian corndogs.
- B. Creates a table of the total count of mysterymeat corndogs split by user.
- C. Creates a table with the count of all types of corndogs eaten split by user.
- D. Creates a table of the total count of users and split by corndogs.

Answer: D

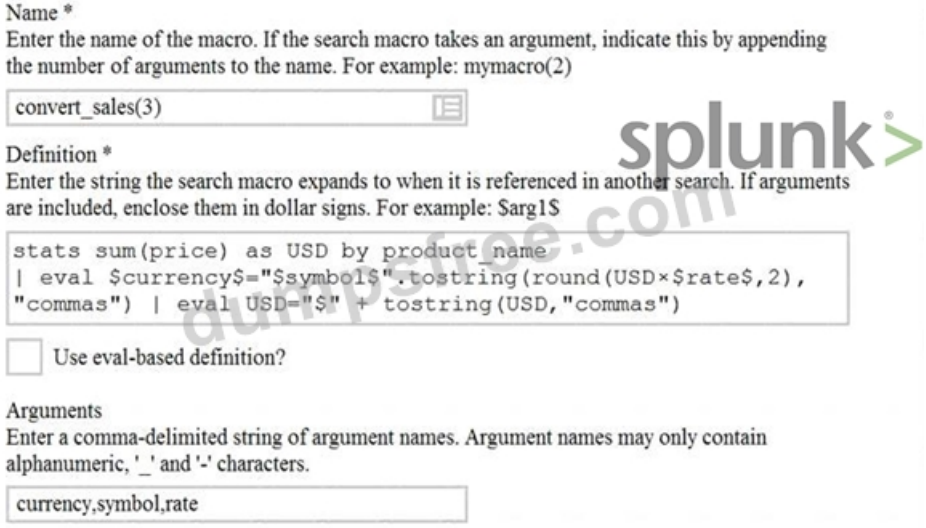
NEW QUESTION # 184
Which of the following knowledge objects can reference field aliases?

- A. Calculated fields and tags only.
- B. Calculated fields, lookups, event types, and tags.
- C. Calculated fields and event types only.
- D. Calculated fields, lookups, event types, and extracted fields.

Answer: B

Explanation:
Field aliases in Splunk are alternate names assigned to fields. These can be particularly useful for normalizing data from different sources or simply for making field names more intuitive. Once an alias is created for a field, it can be used across various Splunk knowledge objects, enhancing their flexibility and utility.
A: Calculated fields, lookups, event types, and tags: This is the correct answer. Field aliases can indeed be referenced in calculated fields, lookups, event types, and tags within Splunk. When you create an alias for a field, that alias can then be used in these knowledge objects just like any standard field name.
* Calculated fields: These are expressions that can create new field values based on existing data. You can use an alias in a calculated field expression to refer to the original field.
* Lookups: These are used to enrich your event data by referencing external data sources. If you've created an alias for a field that matches a field in your lookup table, you can use that alias in your lookup configurations.
* Event types: These are classifications for events that meet certain search criteria. You can use field aliases in the search criteria for defining an event type.
* Tags: These allow you to assign meaningful labels to data, making it easier to search and report on. You can use field aliases in the search criteria that you tag.

NEW QUESTION # 185
Based on the macro definition shown below, what is the correct way to execute the macro in a search string?



- A. Convert_sales ($euro,$€$,s79$
- B. Convert_sales (euro, €, .79)
- C. Convert_sales (euro, €, 79)"
- D. Convert_sales ($euro, $€$,S,79$)

Answer: B

Explanation:
Reference: https://docs.splunk.com/Documentation/Splunk/8.0.3/Knowledge/Usesearchmacros The correct way to execute the macro in a search string is to use the format macro_name($arg1$, $arg2$,
...) where $arg1$, $arg2$, etc. are the arguments for the macro. In this case, the macro name is convert_sales and it takes three arguments: currency, symbol, and rate. The arguments are enclosed in dollar signs and separated by commas. Therefore, the correct way to execute the macro is convert_sales($euro$, $€$,
.79).

NEW QUESTION # 186
Which of the following statements describes this search?
sourcetype=access_combined I transaction JSESSIONID | timechart avg (duration)

- A. No results will be returned because the transaction command must be the last command used in the search pipeline.
- B. This is a valid search and will display a stats table showing the maximum pause among transactions.
- C. This is a valid search and will display a timechart of the average duration, of each transaction event.
- D. No results will be returned because the transaction command must include the startswith and endswith options.

Answer: C

Explanation:
This search uses the transaction command to group events that share a common value for JSESSIONID into transactions1. The transaction command assigns a duration field to each transaction, which is the difference between the latest and earliest timestamps of the events in the transaction1. The search then uses the timechart command to create a time-series chart of the average duration of each transaction1. Therefore, option A is correct because it describes the search accurately. Option B is incorrect because the search does not use the stats command or the pause field. Option C is incorrect because the transaction command does not require the startswith and endswith options, although they can be used to specify how to identify the beginning and end of a transaction1. Option D is incorrect because the transaction command does not have to be the last command in the search pipeline, although it is often used near the end of a search1.
