Exam ISACA CISA Introduction & Flexible CISA Learning Mode

When you are struggling with those troublesome reference books; when you feel helpless to be productive during the process of preparing CISA exams; when you have difficulty in making full use of your sporadic time and avoiding procrastination. It is time for you to realize the importance of our CISA Test Prep, which can help you solve these annoyance and obtain a CISA certificate in a more efficient and productive way. Not only will you be able to pass any CISA test, but will gets higher score, if you choose our CISA study materials.

The CISA certification exam is a rigorous exam that requires a lot of preparation and study. ISACA recommends that candidates have at least five years of experience in information systems auditing, control, or security. Additionally, candidates must adhere to the ISACA Code of Professional Ethics, which requires them to maintain a high level of professionalism and integrity.

The Certified Information Systems Auditor (CISA) Certification Exam is a globally recognized certification for professionals in the field of Information Technology (IT) audit, security, and control. Certified Information Systems Auditor certification is awarded by the Information Systems Audit and Control Association (ISACA), a professional association that provides knowledge and resources to IT professionals around the world. The CISA Certification is designed to assess the knowledge and skills of professionals in the field of IT audit, governance, risk management, and security. It is a highly respected certification that demonstrates the holder's expertise in the field and is often a requirement for employment in IT audit and security positions.

ISACA Certified Information Systems Auditor Sample Questions (Q233-

Q238):

NEW QUESTION # 233
An internet-based attack using password sniffing can:

- A. cause modification to the contents of certain transactions.
- B. enable one party to act as if they are another party.
- C. result in major problems with billing systems and transaction processing agreements.
- D. be used to gain access to systems containing proprietary information.

Answer: D

Explanation:
Password sniffing attacks can be used to gain access to systems on which proprietary information is stored. Spoofing attacks can be used to enable one party to act as if they are another party.
Data modification attacks can be used to modify the contents of certain transactions. Repudiation of transactions can cause major problems with billing systems and transaction processing agreements.

NEW QUESTION # 234
The business owner's approval of software changes being moved into production is PRIMARILY necessary to:

- A. ensure that an application functionality requirement is satisfied.
- B. prevent unauthorized access to data.
- C. inform management of deployments of new functionality.
- D. confirm there is a process to control system changes.

Answer: A

Explanation:
Section: Protection of Information Assets

NEW QUESTION # 235
A LAN administrator normally would be restricted from:

- A. having programming responsibilities.
- B. reporting to the end-user manager.
- C. having end-user responsibilities.
- D. being responsible for LAN security administration.

Answer: A

Explanation:
A LAN administrator should not have programming responsibilities but may have end- user responsibilities. The LAN administrator may report to the director of the IPF or, in a decentralized operation, to the end-user manager. In small organizations, the LAN administrator also may be responsible for security administration over the LAN.

NEW QUESTION # 236
Which of the following should an IS auditor consider FIRST when evaluating firewall rules?

- A. The number of remote nodes
- B. The firewalls' default settings
- C. The physical location of the firewalls
- D. The organization's security policy

Answer: D

Explanation:
This should be the first thing that an IS auditor considers when evaluating firewall rules, because it defines the objectives, standards,

and guidelines for securing the organization's network and information assets. The firewall rules should be aligned with the organization's security policy, and reflect the level of risk and protection required for each type of network traffic, system, or data. The IS auditor should compare the firewall rules with the security policy, and identify any discrepancies, gaps, or conflicts that could compromise the security or performance of the network.

The other options are not as important as the organization's security policy when evaluating firewall rules:

* The number of remote nodes. This is a factor that may affect the complexity and scalability of the firewall rules, but it is not a primary consideration for the IS auditor. Remote nodes are devices or systems that connect to the network from outside locations, such as teleworkers, mobile users, or branch offices. The IS auditor should ensure that the firewall rules provide adequate security and access control for remote nodes, but this depends on the organization's security policy and business needs.

* The firewalls' default settings. These are the predefined configurations that come with the firewall devices or software, and that determine how they handle network traffic by default. The IS auditor should review the firewalls' default settings, and verify that they are appropriate and secure for the organization's network environment. However, the firewalls' default settings may not match the organization's security policy or specific requirements, and may need to be customized or overridden by firewall rules.

* The physical location of the firewalls. This is a factor that may affect the placement and design of the firewall rules, but it is not a critical consideration for the IS auditor. The physical location of the firewalls refers to where they are installed or deployed in relation to the network topology, such as at the network perimeter, between network segments, or on individual hosts. The IS auditor should ensure that the firewall rules are consistent and coordinated across different locations, but this depends on the organization's security policy and network architecture.

NEW QUESTION # 237

An organization has outsourced the development of a core application. However, the organization plans to bring the support and future maintenance of the application back in-house. Which of the following findings should be the IS auditor's GREATEST concern?

- A. The data model is not clearly documented.
- B. The vendor development team is located overseas.
- C. A training plan for business users has not been developed.
- D. The cost of outsourcing is lower than in-house development.

Answer: A
