You must have an active Internet connection to validate your product license.

Salesforce Certified Platform App Builder Sample Questions (Q91-Q96):

NEW QUESTION # 91

An app builder wants to show Groups as the last navigation menu item in the mobile app. However, (he app builder is unable to select Groups as one of the items on the drop-down menu.

What could cause this?

- A. Groups is unavailable in the selected list for the navigation menu.
- B. Groups is included in the Smart Search items but unavailable on the navigation menu.
- C. Groups is available in the recent section of the navigation menu.
- D. Groups is available in the Chatter section of the navigation menu.

Answer: D

Explanation:

Groups is available in the Chatter section of the navigation menu, not in the selected list for the navigation menu. According to the Salesforce documentation, "Groups appear in Chatter, not in Navigation Menu." Groups is not available in the recent section of the navigation menu, nor is it included in the Smart Search items but unavailable on the navigation menu. Groups is unavailable in the

selected list for the navigation menu.

NEW QUESTION # 92

Universal Containers uses a custom object called Reviews to capture information generated by interviewers during the candidate process. The Review records are visible to any user that has access to the related custom Candidate record. The VP of Human Resources wants the comment field on the Review to be private to anyone outside of the MR department. How should the app builder meet this requirement?

- A. Create an Apex sharing rule to share the field with users that have "MR" in their role.
- B. Create a sharing rule to share the field with the VP of HR with Role and Subordinates.
- C. Create a page layout with the field for HR users and another page layout without the field for all other users.
- **D. Create a page layout with the field and use field-level security to hide the field from all other users.**

Answer: D

Explanation:

Create a page layout with the field and use field-level security to hide the field from all other users is how the app builder should meet the requirement of making the comment field on Review private to anyone outside of HR department. Field-level security can control which profiles can view or edit a field on a record. Create an Apex sharing rule, create a sharing rule to share the field with VP of HR with Role and Subordinates, and create a page layout with the field for HR users and another page layout without the field for all other users are not valid or feasible solutions for this requirement.

NEW QUESTION # 93

Universal Containers has a custom picklist called Support Level on the Account object. They would like to show the real-time value of Support Level on all case records.

How should an app builder implement this requirement?

- A. Create a formula field on the Account object using the ISPICKVAL function.
- B. Create a roll-up summary field using Support Level on the Account object.
- **C. Create a formula field on the Case object using the TEXT function.**
- D. Create a Process Builder and use a field update on the Case object.

Answer: C

Explanation:

The best way to implement this requirement is to create a formula field on the Case object using the TEXT function. A formula field can display the value of another field from a related object, such as the Account object. The TEXT function can convert a picklist value into text, which can be displayed on the Case record. Creating a formula field on the Account object using the ISPICKVAL function is not a valid solution, as it does not show the value of Support Level on the Case record. The ISPICKVAL function is used to check if a picklist field has a certain value, not to display it. Creating a Process Builder and using a field update on the Case object is not an optimal solution, as it requires more configuration and maintenance than a formula field. A Process Builder may also introduce delays or errors in updating the field value. Creating a roll-up summary field using Support Level on the Account object is not a valid solution, as it does not show the value of Support Level on the Case record. A roll-up summary field is used to aggregate numeric values from child records, not to display picklist values.

NEW QUESTION # 94

Universal Containers (UC) needs a picklist field called Status on three separate custom objects. UC has a requirement to share the list of values for this field across each object.

- A. Related Picklist
- B. Shared Custom Field
- C. Dependent Picklist
- **D. Global Picklist Value Set**

Answer: D

Explanation:

When multiple objects require the same picklist values, the correct approach is to create a Global Picklist Value Set (also called a

Global Value Set). This allows an organization to maintain one centralized list of picklist values that can be reused across multiple picklist fields on different objects.

Why C is correct:Exact Extract:"Global value sets let you share the same picklist values with more than one picklist field. A global value set is a set of shared values that you define once and use in multiple custom picklist fields." - Salesforce Help | Global Value Sets
This ensures consistent data values, simplifies maintenance, and makes changes automatically available wherever the global picklist is used.

Why C is correct:Exact Extract:"Global value sets let you share the same picklist values with more than one picklist field. A global value set is a set of shared values that you define once and use in multiple custom picklist fields." - Salesforce Help | Global Value Sets
This ensures consistent data values, simplifies maintenance, and makes changes automatically available wherever the global picklist is used.

Why not A (Related Picklist):"Related Picklist" is not a valid Salesforce feature.

Why not B (Shared Custom Field):Salesforce does not provide a "Shared Custom Field" functionality. Each field belongs to a specific object.

Why not D (Dependent Picklist):Dependent picklists control available values based on another field's value. They do not allow reuse of a single value list across multiple objects.

NEW QUESTION # 95

A new custom object is being created with a private sharing setting. The business wants to share individual records with specific people or group of people on a case-by-case basis. What options does the business user have to manually share individual records? Choose 3 answers

- A. Profiles
- B. Roles
- C. Users
- D. Permission Sets
- E. Public Groups

Answer: B,C,E

Explanation:

To manually share individual records with specific people or group of people on a case by case basis, users can use public groups, roles, or users. Public groups are collections of users, roles, or other groups that can be used to share access to records. Roles define the level of access that users have to their organization's data based on their position in the hierarchy. Users are individual people who log in to Salesforce and have access to records based on their profile, role, and sharing settings.

NEW QUESTION # 96

.....

All the ValidVCE Salesforce Plat-Admn-202 practice questions are real and based on actual Salesforce Certified Platform App Builder (Plat-Admn-202) exam topics.
