NEW QUESTION # 112

A new network requires multiple topology support. You decide to use IS-IS in this situation. Which three protocol topologies are supported in this scenario? (Choose three.)

- A. IPsec
- B. IPv6
- C. anycast
- D. multicast
- E. IPv4

Answer: B,D,E

Explanation:

IS-IS (Intermediate System to Intermediate System) is a routing protocol that is designed to move information efficiently within a computer network. It supports multiple protocol topologies, including IPv4, IPv6, and multicast.

NEW QUESTION # 113

Referring to the exhibit, which configuration change is needed for an IS-IS Level 1 adjacency between R1 and R2?

```
user@R1# show interfaces lo0
unit 0 {
    family inet {
        address 10.42.0.1/32;
    }
    family iso {
        address 49.0002.0010.0042.0001.00;
    }
}

user@R1# show protocols isis
interface ge-0/0/1.0 {
    level 2 disable;
}
interface lo0.0;

user@R2# show interfaces lo0
unit 0 {
    family inet {
        address 10.42.0.2/32;
    }
    family iso {
        address 49.0001.0010.0042.0002.00;
    }
}
```

- A. Disable Level 2 on R2's ge-0/0/1 interface
- B. Configure the lo0 family ISO address 49.0002.0010.0042.0002.00 on R1
- C. Configure the lo0 family ISO address 49.0002.0010.0042.0002.00 on R2
- D. Enable Level 2 on R1's ge-0/0/1 interface

Answer: C

NEW QUESTION # 114

You are deploying a trunk port with multiple VLANs. In this scenario, which statement is true about the native VLAN?

- A. The native VLAN is the highest tagged VLAN ID on the port.
- B. The native VLAN must be the default VLAN on the port.
- C. The native VLAN is an untagged VLAN ID on the port.
- D. The native VLAN is automatically configured through DHCP.

Answer: C

NEW QUESTION # 115

Two routers share the same highest priority and start time.

- A. The router with the highest router ID becomes the DR
- B. The routers perform another DR election.
- C. The router with the highest MAC address become the DR
- D. In this situation, what is evaluated next when determining the designated router? The router with the lowest router ID become the DR.

Answer: A

Explanation:

According to the OSPF protocol, the designated router (DR) is the router that acts as the focal point for exchanging routing information on a multi-access network segment, such as a LAN1. The DR election process is based on the following criteria, in order of precedence1:

The router with the highest OSPF priority becomes the DR. The default priority is 1, and a priority of 0 means the router will not participate in the election.

If there is a tie in priority, the router with the highest router ID becomes the DR. The router ID is a 32-bit number that uniquely identifies a router in an OSPF domain. It can be manually configured or automatically derived from the highest IP address of a loopback interface or a physical interface.

If there is a tie in router ID, the router that was first to become an OSPF neighbor becomes the DR.

In your scenario, two routers share the same highest priority and start time. This means that they have equal chances of becoming the DR based on the first and third criteria. Therefore, the second criterion will be used to break the tie, which is the router ID. The router with the highest router ID will become the DR, and the other router will become the backup designated router (BDR), which is ready to take over the role of DR if it fails1.
