2026 Reliable TDA-C01 Exam Preparation - Realistic Tableau Tableau Certified Data Analyst Valid Exam Registration 100% Pass

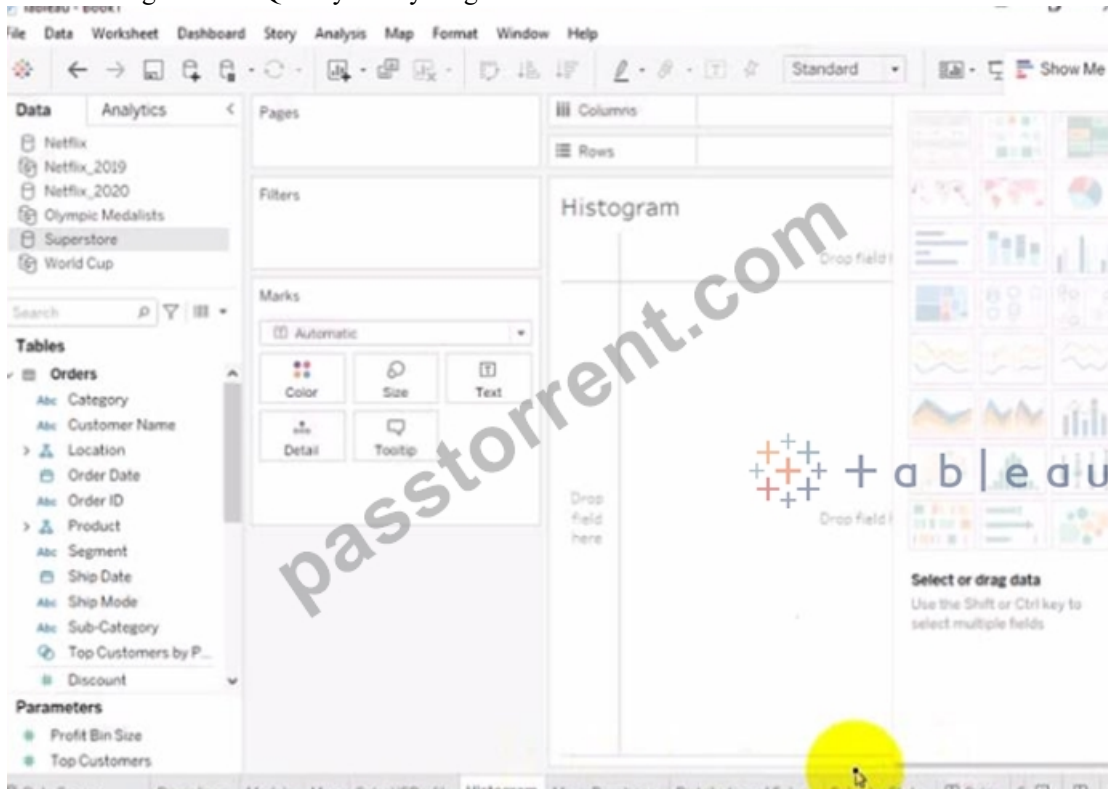

The PassTorrent TDA-C01 exam practice test questions provide a way to assess your understanding of the material, identify areas for improvement, and build confidence and test-taking skills. The PassTorrent TDA-C01 exam practice test questions are real and verified by Tableau Certified Data Analyst (TDA-C01) exam trainers. They work collectively and strive hard to ensure the top standard of Tableau Certified Data Analyst (TDA-C01) exam practice questions all the time.

Tableau TDA-C01 exam is an excellent opportunity for individuals to validate their Tableau skills and demonstrate their proficiency in data analysis. Tableau Certified Data Analyst certification is recognized globally and can help individuals advance their careers in the field of data analytics. With the increasing demand for data analysts in various industries, obtaining the Tableau TDA-C01 Certification can be a valuable asset for individuals looking to stand out in a competitive job market.

Tableau Certified Data Analyst Sample Questions (Q19-Q24):

NEW QUESTION # 19

Open the link to Book1 found on the desktop. Open the Histogram worksheet and use the Superstore data source. Create a histogram on the Quantity field by using bin size of 3.

- A. check the steps below in explanation

Answer: A

Explanation:

To create a histogram on the Quantity field by using bin size of 3, you need to do the following steps:

Open the link to Book1 found on the desktop. This will open the Tableau workbook that uses the Superstore data source.

Click on the Histogram tab at the bottom of the workbook to open the Histogram worksheet. You will see a blank worksheet with no marks.

Right-click on Quantity in the Measures pane and select Create Bins from the menu. This will open a dialog box that allows you to create bins for the Quantity field. Bins are groups of values that are treated as one unit in a histogram.

Enter 3 in the Size of bins text box. This will set the bin size to 3, which means that each bin will contain values that are 3 units apart. For example, one bin will contain values from 0 to 2, another bin will contain values from 3 to 5, and so on.

Click OK to create the bins. You will see a new field named Quantity (bin) in the Measures pane with a # sign next to it.

Drag Quantity (bin) from the Measures pane to Columns on the worksheet. This will create a histogram that shows the distribution of Quantity by bins. You will see bars that represent the frequency or count of values in each bin.

Optionally, you can adjust the width, color, and labels of the bars by using the options on the Marks card. You can also add filters, tooltips, or annotations to enhance your histogram.

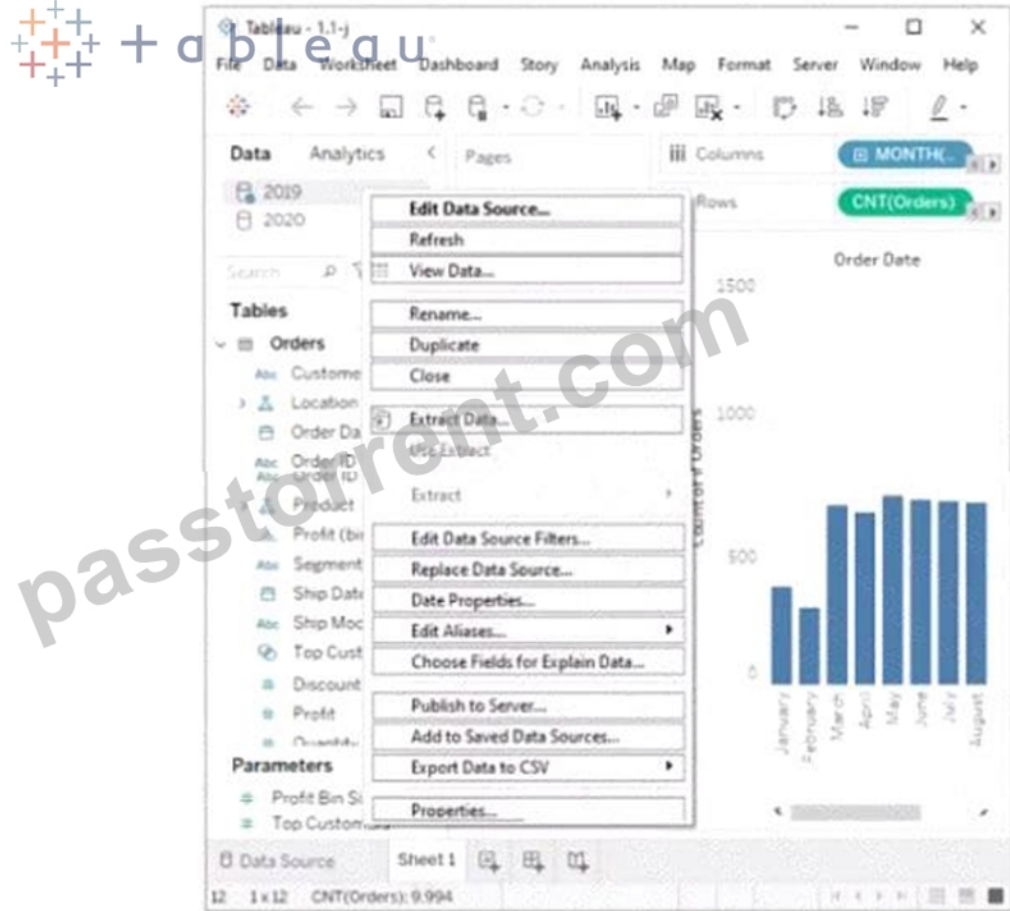

NEW QUESTION # 20

You have two data sources that use the same schema. One data source contains order data from 2019 and the other data source contains order data from 2020.

You have a worksheet that shows the orders from 2019.

You need to configure the worksheet to show the orders from 2020 without reloading the data.

Which option should you select?

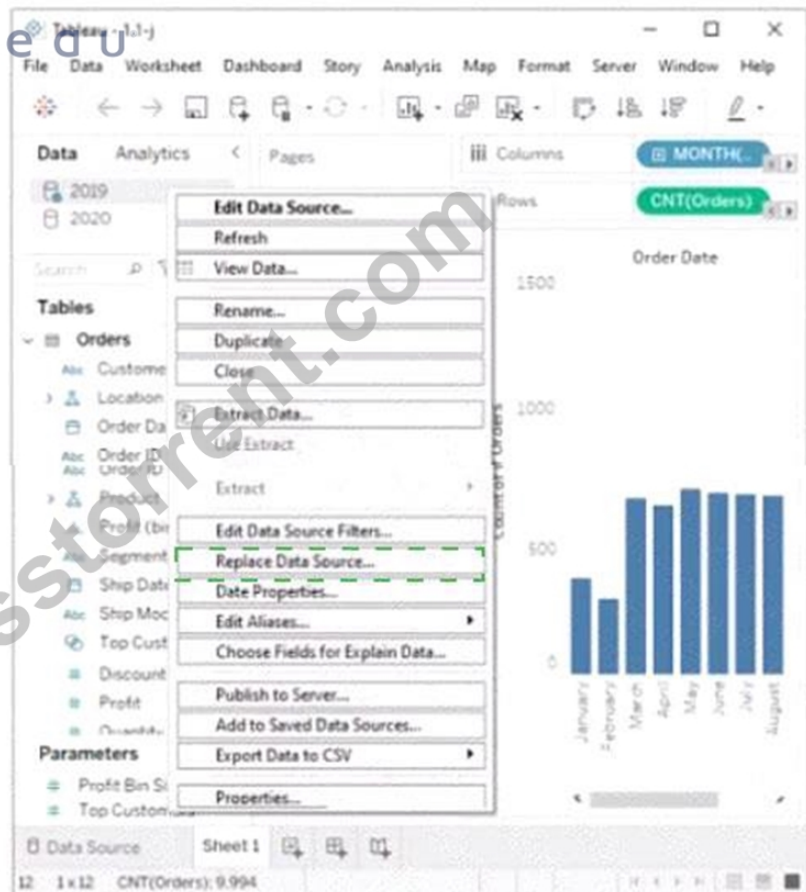

Answer:

Explanation:

+ a b l e a u

Explanation:

Replace Data Source

Replace Data Source is a feature that allows you to replace one data source with another one that has the same or similar fields and structure. It updates all the worksheets that use the original data source with the new one, without reloading the data. In this case, you want to replace the data source that contains order data from 2019 with the one that contains order data from 2020.

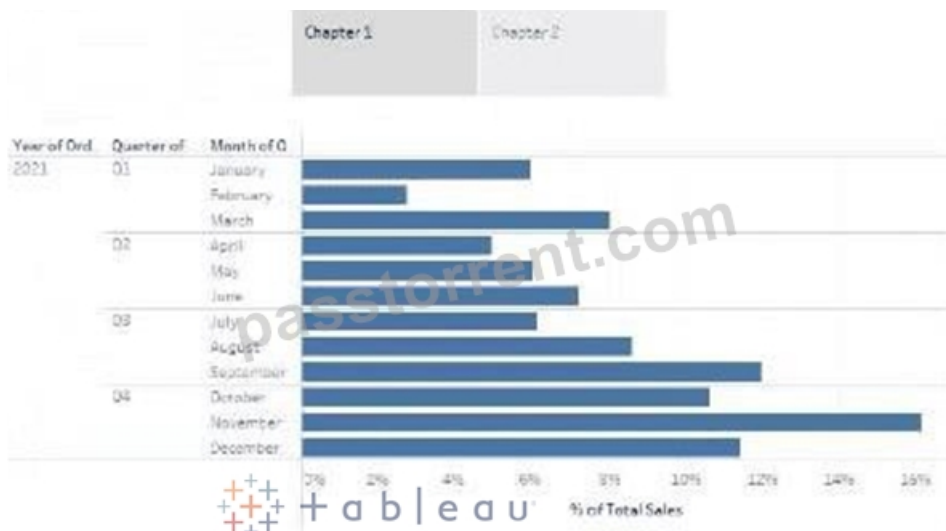

To replace the data source, you need to do the following steps:

- * Go to the Data Source tab at the bottom of the workbook to see the data source page. You will see a table that shows the fields and values from the original data source.
- * Click on the drop-down arrow next to the data source name at the top of the page and select Replace Data Source from the menu. This will open a dialog box that allows you to replace your data source with another one.
- * Select the data source that contains order data from 2020 from the list of available data sources and click OK. This will replace your original data source with the new one and update your worksheet accordingly. You may need to fix any broken fields or calculations that result from the replacement.

NEW QUESTION # 21

A Data Analyst creates the following story that contains two story points.

The analyst wants to change the story point format to show the current story point number out of the total number of story points. Which Layout option should the analyst use?

- A. Arrows only
- B. Caption boxes
- C. Numbers
- D. Dots

Answer: A

NEW QUESTION # 22

You have the following chart that shows profits and discounts over time.

You need to combine the lines to appear as shown in the following chart.

What should you do?

- A. Convert Discount to Discrete
- B. Drag Discount to the Columns shelf
- C. Set Discount to Dual Axis
- D. Drag Discount to Color on the Marks card

Answer: C

Explanation:

To combine the lines to appear as shown in the second chart, you should set Discount to Dual Axis. Dual Axis is a feature that allows you to show two measures on two separate axes on one chart. You can create a dual axis by right-clicking on a measure on any shelf and selecting Dual Axis from the menu. This will create two axes on one chart and synchronize their scales.

In this case, you want to show Profit and Discount on two separate axes on one chart. You can right-click on Discount on any shelf and select Dual Axis from the menu. This will create a dual axis chart that shows Profit and Discount as two lines with different colors.

The other options are not correct for this scenario. Dragging Discount to Color on the Marks card will change the color of Profit based on Discount, but it will not show two lines. Converting Discount to Discrete will change Discount from a green pill to a blue pill, but it will not affect how it appears on the chart. Dragging Discount to Columns shelf will create two separate charts for Profit and Discount, but it will not combine them. NEW QUESTION # 23

You have the following dataset.

Quarter	Sales	Calculation
2010 Q1	43,971	
2010 Q2	20,301	
2010 Q3	58,872	
2010 Q4	36,522	
2011 Q1	44,261	0.66%
2011 Q2	52,982	160.98%
2011 Q3	45,264	-23.11%
2011 Q4	63,121	72.83%
2012 Q1	87,867	98.52%
2012 Q2	77,777	46.80%
2012 Q3	118,448	161.68%
2012 Q4	83,829	32.81%

Which formula calculates the percent difference in sales relative to the same quarter the previous year as shown in the Calculation field?

- A. $(ZN(SUM([Sales])) - LOOKUP(ZN(SUM([Sales])), -4))$
- B. $(SUM([Sales]) - LOOKUP(SUM([Sales]), -4))$
- C. $(SUM([Sales]) / (LOOKUP(SUM([Sales]), -4))$

- D. $(\text{SUM}([\text{Sales}]) - \text{LOOKUP}(\text{SUM}([\text{Sales}]), -4)) / (\text{LOOKUP}(\text{SUM}([\text{Sales}]), -4))$

Answer: D

Explanation:

The formula in option B calculates the percent difference in sales relative to the same quarter the previous year. It subtracts the sales of the same quarter from the previous year from the current year's sales, and then divides this by the previous year's sales. This gives a percentage change, which aligns with what is shown in the Calculation field of your dataset. The LOOKUP function returns the value of a specified offset from the current row in the partition. In this case, the offset is -4, which means the value of the same measure four rows above the current row. This corresponds to the same quarter of the previous year, assuming the data is sorted by quarter. References:
