New C-SEC-2405 Exam Actual Tests | Reliable C-SEC-2405 Exam Cost: SAP Certified Associate - Security Administrator

After passing the SAP C-SEC-2405 certification exam, you can take advantage of a number of extra benefits. With the correct concentration, commitment, and C-SEC-2405 exam preparation, you could ace this SAP Certified Associate - Security Administrator C-SEC-2405 test with ease. TestPassKing is a trusted and leading platform that is committed to preparing the SAP C-SEC-2405 exam candidates in a short time period.

SAP Certified Associate - Security Administrator Sample Questions (Q24-Q29):

NEW QUESTION # 24

Which solution analyzes an SAP system's administrative areas to safeguard against potential threats?

- A. SAP EarlyWatch Alert
- **B. SAP Security Optimization Services**
- C. SAP Enterprise Threat Detection
- D. SAP Code Vulnerability Analyzer

Answer: B

NEW QUESTION # 25

Your developer has created a new custom transaction for your SAP S/4HANA on-premise system and has provided you a list of the authorizations needed to execute the new ABAP program. What must you do to ensure that each required authorization is automatically created every time this new custom transaction is added to a PFCG role?

- A. Maintain each authorization in transaction SU22 and set the Check Indicator value to "Check".
- **B. Maintain each authorization object in transaction SU24 and set the Default Status to "Yes".**
- C. Maintain each authorization object in transaction SU22 and set the Default Status to "Yes".
- D. Maintain each authorization in transaction SU24 and set the Default Status to "Yes".

Answer: B

NEW QUESTION # 26

Which object type is assigned to activated OData services in transaction SU24?

- **A. IWSV**
- B. HTTP
- C. IWSG
- D. G4BA

Answer: A

Explanation:

In SAP systems, activated OData services are assigned the object type IWSV (SAP Gateway Business Suite Enablement-Service) in transaction SU24. SU24 is used to maintain authorization defaults for transactions and services, and for OData services, which power SAP Fiori apps, the IWSV object type represents the service definitions required for front-end and back-end communication. When an OData service is activated, its authorization requirements, such as the S_SERVICE authorization object with the SRV_NAME field, are linked to the IWSV type in SU24, ensuring that these are proposed when the service is added to a PFCG role.

The HTTP object type is not used for OData services, G4BA relates to OData V4 services, and IWSG represents service group metadata, not activated services. By associating OData services with IWSV in SU24, SAP ensures that authorization maintenance is streamlined, enabling secure and efficient access to Fiori apps while aligning with the system's authorization framework.

NEW QUESTION # 27

After you maintained authorization object S_TABU_DIS and ACTVT field value 02 as authorization defaults for transaction SM30

in your development system, what would be the correct option for transporting only these changes to your quality assurance system?

- **A. Save your changes to a Workbench transport request and transport using the Transport Management System.**
- B. Save your changes and use the transport interface in SU25 to transport the changes using the Transport Management System.
- C. Save your changes to a Customizing transport request and transport using the Transport Management System.
- D. Save tables USOBT_C and USOBX_C to a transport request and transport using the Transport Management System.

Answer: A

Explanation:

When you maintain authorization defaults (e.g., adding authorization object S_TABU_DIS with ACTVT value 02 for transaction SM30) and need to transport these changes:

- * Changes are Cross-Client and Repository-Based:
- * Authorization default changes in SU24 are considered cross-client because they affect all clients in the system.
- * These changes are part of the SAP repository and are treated as Workbench requests.
- * Save Changes to a Workbench Transport Request:
- * Upon saving changes in SU24, the system prompts you to assign them to a transport request.
- * Select or create a Workbench transport request to capture the changes.
- * Use the Transport Management System (TMS):
- * Use TMS to transport the Workbench request from the development system to the quality assurance system.
- * This ensures that the authorization defaults are consistently applied across systems.

Why Other Options Are Incorrect:

- * Option B: Customizing transport requests are client-specific and not suitable for cross-client repository changes.
- * Option C: Manually transporting tables USOBT_C and USOBX_C is not recommended and can lead to inconsistencies.
- * Option D: SU25 is used for post-upgrade authorization adjustments, not for transporting SU24 changes.

SAP Security References:

- * SAP Help Portal: Transporting Authorization Data Changes
- * SAP Documentation: Using Workbench Requests for Cross-Client Objects
- * SAP Note: Best Practices for Transporting SU24 Authorization Defaults

NEW QUESTION # 28

Following an upgrade of your SAP S/4HANA on-premise system to a higher release, you perform a Modification Comparison using SU25. What does this comparison do?

- A. It compares your changes to the SAP defaults in USOBX_C and USOBT_C with the new SAP defaults in the current release and allows you to make adjustments.
- **B. It compares your changes to the SAP defaults in USOBX and USOBT with the new SAP defaults in the current release and allows you to make adjustments.**
- C. It compares the Role Maintenance data from the previous release with the data for the current release and writes any new default values in tables USOBX_C and USOBT_C.
- D. It compares the Role Maintenance data from the current release with the data for the previous release and allows you to adjust any custom default values in tables USOBX and USOBT.

Answer: B

Explanation:

The Modification Comparison using transaction SU25 is a critical step after an SAP S/4HANA on-premise system upgrade. It compares custom changes made to the SAP default authorization data stored in tables USOBX (Check Indicators) and USOBT (Authorization Objects) with the new SAP default values provided in the upgraded release. This process identifies discrepancies between your customized settings and the new standards, allowing you to review and adjust authorizations to align with the updated system requirements. By doing so, it ensures that role maintenance remains consistent and secure, preventing potential authorization issues. The comparison does not involve USOBX_C or USOBT_C, which are customer-specific tables, nor does it directly write new default values or compare role maintenance data across releases.

NEW QUESTION # 29

.....

The pressure is not terrible, and what is terrible is that you choose to evade it. You clearly have seen your own shortcomings, and

you know that you really should change. Then, be determined to act! Buying our C-SEC-2405 exam questions is the first step you need to take. And as long as you study with our C-SEC-2405 Practice Guide, you will find that the exam is just a piece of cake and the certification is easy to get. With the certification, you will find your future is much brighter.
