Cisco Designing Cisco Enterprise Wireless Networks Sample Questions (Q44-Q49):

NEW QUESTION # 44
An engineer is designing a solution where guests terminate on an anchor controller in the DMZ.
The engineer is having issues and wants to test connectivity between members of a mobility group. Which command must be issued to test whether a mobility control packet is able to be reached over the management interface?

- A. ping
- B. arp
- C. tracert
- D. show logging

Answer: A

Explanation:
Mobility control communication between WLCs uses the management interface. Issuing a ping from one controller to another verifies basic IP reachability over the management interface, which is required for mobility control packets to be exchanged successfully.

NEW QUESTION # 45
A customer is running a guest WLAN with a foreign/export-anchor setup. There is one anchor WLC in the US and two in Europe. Anchor WLC priorities are used to prefer local anchors. During a routine network audit, it is discovered that a large number of guest client sessions in the US are anchored to the WLCs in Europe.
Which
reason explains this behavior?

- A. The foreign WLC failed and recovered.
- B. The anchor WLC is in the same mobility group.
- C. The US anchor WLC is anchored to itself with a priority value of zero.
- D. The US anchor WLC failed and recovered.

Answer: D

Explanation:
The behavior of guest client sessions in the US being anchored to the WLCs in Europe despite the presence of a local anchor WLC can be explained by the failure and subsequent recovery of the US anchor WLC. During the failure, the guest sessions would have been transferred to the European WLCs. After recovery, if the priority settings were not correctly restored or if the system did not automatically revert back to the local anchor, the sessions would remain anchored to the European WLCs3.
