ISC Certified Information Systems Security Professional (CISSP) Sample Questions (Q353-Q358):

NEW QUESTION # 353
Rewritable and erasable (CDR/W) optical disk are sometimes used for backups that require short time storage for changeable data, but require?

- A. Slower file access than scale.
- B. Slower file access than drive.
- C. Faster file access than tape.
- D. Slower file access than tape.

Answer: C

Explanation:
This is true, when we use optical media like CD's to make our backups we need a constant throughput on the file access and data transfer inside the disk because of the risk to get a buffer overrun error in the CD writer. If the buffer user by the CD burner is empty and the Hard disk does not provide data for that time, the
Backup will be unsuccessful. This can be solved with a Technology known as "Burn
Proof".

NEW QUESTION # 354
In the OSI/ISO model, at what level are TCP and UDP provided?

- A. Application
- B. Network
- C. Transport
- D. Presentation

Answer: C

Explanation:
Transport Layer. .... TCP and UDP operate on this layer.' Pg 82. Krutz: The CISSP Prep Guide.

NEW QUESTION # 355
Which is a property of a circuit-switched network as opposed to a packetswitched
network?

- A. The data is sent to the next destination, which is based on the router's understanding of the best available route.
- B. Physical, permanent connections exist from one point to another in a circuit-switched network.
- C. The data is broken up into packets.
- D. Packets are reassembled according to their originally assigned sequence numbers.

Answer: B

Explanation:
The correct answer is "Physical, permanent connections exist from one point to another in a
circuit-switched network". Permanent connections are a feature of circuit-switched networks.
Note: strictly speaking they aren't physical and they aren't permanent.
A phone call is circuit-switched (well, historically). The circuit wasn't permanent, just for the
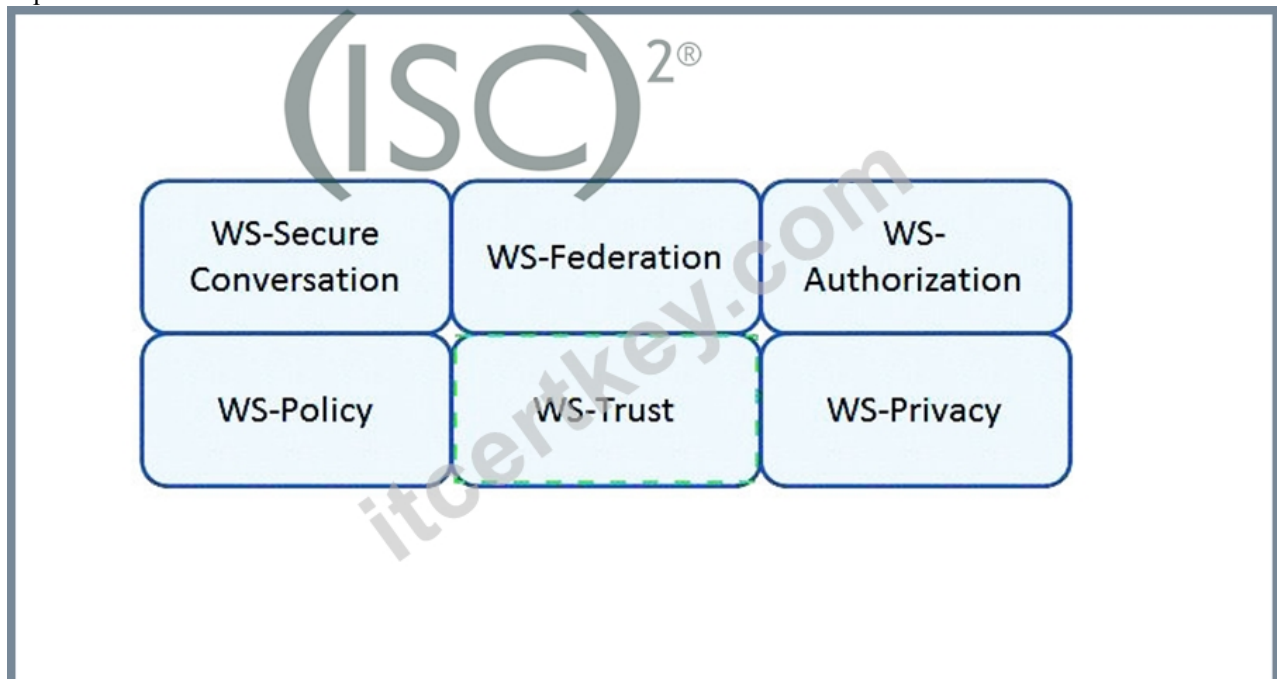

duration of the call.

NEW QUESTION # 356
Which Web Services Security (WS-Security) specification negotiates how security tokens will be issued, renewed and validated?
Click on the correct specification in the image below.
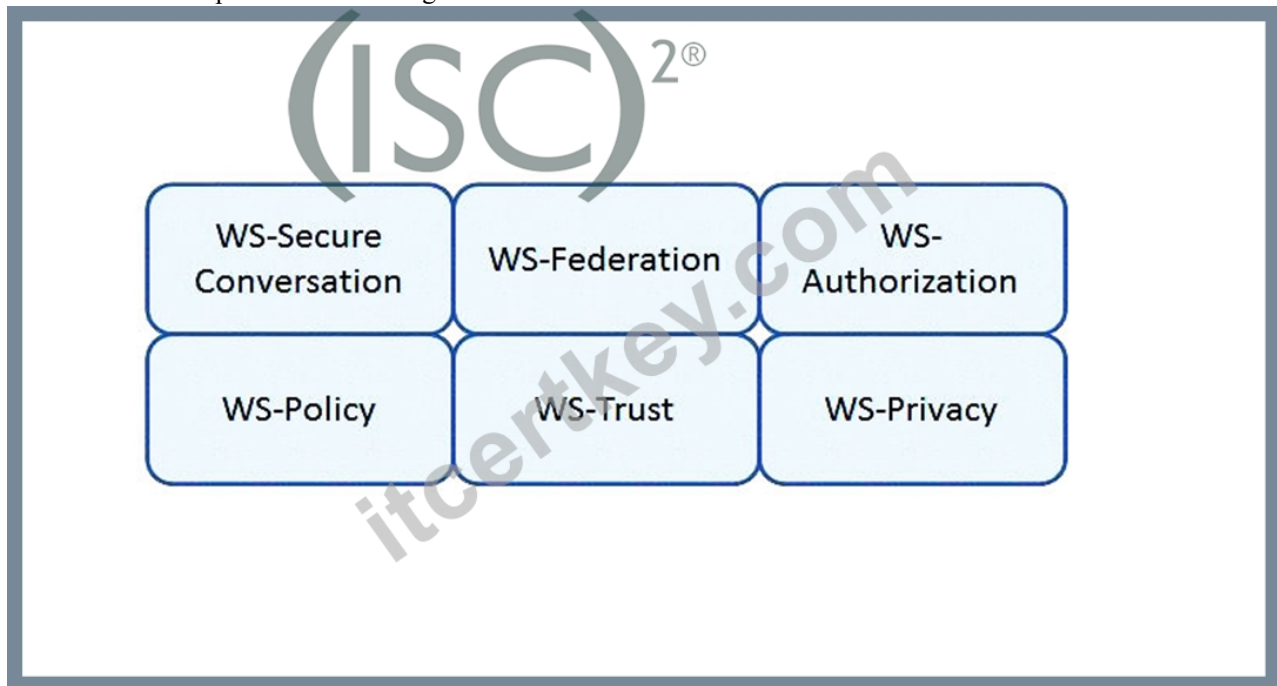

Answer:

Explanation:

Explanation
WS-Trust
The protocol used for issuing security tokens is based on WS-Trust. WS-Trust is a Web service specification that builds on WS-Security. It describes a protocol used for issuance, exchange, and validation of security tokens. WS-Trust provides a solution for interoperability by defining a protocol for issuing and exchanging security tokens, based on token format, namespace, or trust boundaries.

NEW QUESTION # 357
Which of the following are functions that are compatible in a properly segregated environment?

- A. Security administration and application programming
- B. Application programming and data entry
- C. Security administration and quality assurance
- D. Security administration and data entry

Answer: C

Explanation:
Security Administration and Quality Assurance are the most similar tasks.
Administrative Management: Administrative management is a very important piece of operational security. One aspect of administrative management is dealing with personnel issues. This includes separation of duties and job rotation. The objective of separation of duties is to ensure that one person acting alone cannot compromise the company's security in any way. High-risk activities should be broken up into different parts and distributed to different individuals. This way the company does not need to put a dangerously high level of trust on certain individuals and if fraud were to take place, collusion would need to be committed, meaning more than one person would have to be involved in the fraudulent activity.
Separation of duties also helps to prevent many different types of mistakes that can take place if one person is performing a task from the beginning to the end. For instance, a programmer should not be the one to test her own code. A different person with a different job and agenda should perform functionality and integrity testing on the programmer's code because the programmer may have a focused view of what the program is supposed to accomplish and only test certain functions, input values, and in certain environments.
Another example of separation of duties is the difference between the functions of a computer operator versus the functions of a system administrator. There must be clear cut lines drawn between system administrator duties and computer operator duties. This will vary from environment to environment and will depend on the level of security required within the environment. The system administrators usually have responsibility of performing backups and recovery procedures, setting permissions, adding and removing users, setting user clearance, and developing user profiles. The computer operator on the other hand, may be allowed to install software, set an initial password, alter desktop configurations, and modify certain system parameters. The computer operator should not be able to modify her own security profile, add and remove users globally, or set user security clearance. This would breach the concept of separation of duties.
