Amazon AWS-Certified-Developer-Associate Valid Exam Cram - Latest AWS-Certified-Developer-Associate Exam Vce

Our Amazon AWS-Certified-Developer-Associate practice test software is the most distinguished source for the Amazon AWS-Certified-Developer-Associate exam all over the world because it facilitates your practice in the practical form of the AWS-Certified-Developer-Associate Certification Exam. Moreover, you do not need an active internet connection to utilize AWS Certified Developer Associate Exam (DVA-C02) practice exam software.

Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q61-Q66):

NEW QUESTION # 61

A company is running Amazon EC2 instances in multiple AWS accounts. A developer needs to implement an application that collects all the lifecycle events of the EC2 instances. The application needs to store the lifecycle events in a single Amazon Simple Queue Service (Amazon SQS) queue in the company's main AWS account for further processing. Which solution will meet these requirements?

- A. Write an AWS Lambda function that scans through all EC2 instances in the company accounts to detect EC2 instance lifecycle changes. Configure the Lambda function to write a notification message to the SQS queue in the main account if the function detects an EC2 instance lifecycle change. Add an Amazon EventBridge scheduled rule that invokes the Lambda function every minute.
- **B. Configure the permissions on the main account event bus to receive events from all accounts. Create an Amazon EventBridge rule in each account to send all the EC2 instance lifecycle events to the main account event bus. Add an EventBridge rule to the main account event bus that matches all EC2 instance lifecycle events. Set the SQS queue as a target for the rule.**
- C. Configure Amazon EC2 to deliver the EC2 instance lifecycle events from all accounts to the Amazon EventBridge event bus of the main account. Add an EventBridge rule to the event bus of the main account that matches all EC2 instance lifecycle events. Add the SQS queue as a target of the rule.
- D. Use the resource policies of the SQS queue in the main account to give each account permissions to write to that SQS queue. Add to the Amazon EventBridge event bus of each account an EventBridge rule that matches all EC2 instance lifecycle events. Add the SQS queue in the main account as a target of the rule.

Answer: B

NEW QUESTION # 62

Can one instance be registered with two ELBs in the same region?

- A. No
- **B. Yes, always**
- C. Yes, provided both ELBs have the same health check configuration
- D. Yes, provided both ELBs are in the same AZ

Answer: B

Explanation:

Yes, it is possible to have one instance part of two separate ELBs, though both ELBs have different configurations. ELBs are never launched in specific zones.

NEW QUESTION # 63

An Amazon RDS database instance is used by many applications to look up historical data. The query rate is relatively constant. When the historical data is updated each day, the resulting write traffic slows the read query performance and affects all application users.

What can be done to eliminate the performance impact on application users?

- A. Implement Amazon ElastiCache in front of Amazon RDS to buffer the write traffic.
- B. Make sure Amazon RDS is Multi-AZ so it can better absorb increased traffic.
- **C. Create an RDS Read Replica and direct all read traffic to the replica.**
- D. Use Amazon DynamoDB instead of Amazon RDS to buffer the read traffic.

Answer: C

NEW QUESTION # 64

The release process workflow of an application requires a manual approval before the code is deployed into the production environment.

What is the BEST way to achieve this using AWS CodePipeline?

- **A. Use an approval action in a stage**
- B. Disable a stage just prior the deployment stage
- C. Use multiple pipelines to allow approval

- D. Disable the stage transition to allow manual approval

Answer: A

Explanation:

Explanation

Refer AWS documentation - CodePipeline Approvals

In AWS CodePipeline, you can add an approval action to a stage in a pipeline at the point where you want the pipeline execution to stop so that someone with the required AWS Identity and Access Management permissions can approve or reject the action.

If the action is approved, the pipeline execution resumes. If the action is rejected-or if no one approves or rejects the action within seven days of the pipeline reaching the action and stopping-the result is the same as an action failing, and the pipeline execution does not continue.

You might use manual approvals for these reasons:

- * You want someone to perform a code review or change management review before a revision is allowed into the next stage of a pipeline.
- * You want someone to perform manual quality assurance testing on the latest version of an application, or to confirm the integrity of a build artifact, before it is released.
- * You want someone to review new or updated text before it is published to a company website.

NEW QUESTION # 65

EC2 instances are launched from Amazon Machine images (AMIs). A given public AMI can:

- A. only be used to launch EC2 instances in the same AWS region as the AMI is stored.
- B. only be used to launch EC2 instances in the same country as the AMI is stored.
- C. only be used to launch EC2 instances in the same AWS availability zone as the AMI is stored
- D. be used to launch EC2 Instances in any AWS region.

Answer: A

NEW QUESTION # 66

.....

Because there are free trial services provided by our AWS-Certified-Developer-Associate preparation materials, by the free trial services you can get close contact with our products, learn about our AWS-Certified-Developer-Associate real test, and know how to choose the different versions before you buy our products. On the other hand, using free trial downloading before purchasing, I can promise that you will have a good command of the function of our AWS-Certified-Developer-Associate Test Prep. According to free trial downloading, you will know which version is more suitable for you.
