NEW QUESTION # 123

Task 9

You need to ensure that all the computers in the domain use DNSSEC to resolve names in the adatum.com zone.

Answer:

Explanation:

See the solution of this Task below.

Explanation:

To ensure that all computers in the domain use DNSSEC to resolve names in the adatum.com zone, you'll need to configure both the DNS servers and the client computers. Here's how you can do it:

Step 1: Sign the adatum.com Zone First, you need to sign the adatum.com DNS zone. This can be done using the DNS Manager or PowerShell. Here's a PowerShell example:

```
Add-DnsServerSigningKey -ZoneName "adatum.com" -CryptoAlgorithm RsaSha256 Set-DnsServerDnsSecZoneSetting -ZoneName "adatum.com" -DenialOfExistence NSEC3 -NSEC3Parameters 1,0,10,""
```

This will add a signing key and configure DNSSEC for the zone with NSEC3 parameters.

Step 2: Configure DNS Servers Ensure that your DNS servers are configured to support DNSSEC. This includes setting up trust anchors for the zones that you want to validate and configuring the DNS servers to provide DNSSEC validation for DNS queries.

Step 3: Configure DNS Clients For DNSSEC validation to occur on the client side, the client computers must be configured to trust the DNS server's validation process. This typically involves configuring the client's DNS settings to point to a DNS server that supports DNSSEC.

Step 4: Validate Configuration You can validate that DNSSEC is working correctly by using tools like nslookup or dig to query DNS records and check for the presence of DNSSEC signatures in the responses.

Note: The exact steps may vary depending on your environment and the version of Windows Server you are using. Ensure that you have the appropriate administrative rights to make these changes and that you test the configuration in a controlled environment before deploying it domain-wide.

By following these steps, you should be able to ensure that all computers in your domain use DNSSEC to resolve names in the

adatum.com zone.
