Salesforce Platform Developer I (PDI) Sample Questions (Q199-Q204):

NEW QUESTION # 199

A developer identifies the following triggers on the Expense__c object:

```
deleteExpense,  
applyDefaultsToExpense,  
validateExpenseUpdate;
```

The triggers process before delete, before insert, and before update events respectively.

Which two techniques should the developer implement to ensure trigger best practices are followed?

Choose 2 answers

- A. Unify the before insert and before update triggers and use Flow for the delete action.
- B. Unify all three triggers in a single trigger on the Expense__c object that includes all events.
- C. Create helper classes to execute the appropriate logic when a record is saved.
- D. Maintain all three triggers on the Expense__c object, but move the Apex logic out of the trigger definition.

Answer: B,C

Explanation:

* A. Unify all three triggers in a single trigger on the Expense__c object that includes all events:

* Salesforce best practices recommend having only one trigger per object to avoid redundancy and conflicts.

* By combining all the events (before delete, before insert, and before update) into a single trigger, the developer can manage the logic in an organized and maintainable manner.

* This also simplifies debugging and ensures that the trigger logic executes in a predictable order.

* C. Create helper classes to execute the appropriate logic when a record is saved:

* Using helper classes allows for a clean separation of concerns. The trigger becomes a dispatcher that delegates logic to dedicated classes.

* For example, you can create methods like applyDefaultsToExpense(), validateExpenseUpdate(), and deleteExpense() in a helper class and invoke them from the trigger.

* This improves reusability, readability, and testability of the code.

Why not the other options?

* B. Unify the before insert and before update triggers and use Flow for the delete action:

* While Flow is a powerful tool, it is not ideal for deleting records or replacing Apex trigger functionality, especially when triggers already exist for other events.

* D. Maintain all three triggers on the Expense__c object but move the Apex logic out of the trigger definition:

* Maintaining multiple triggers on the same object can lead to conflicts and execution order issues, even if the logic is moved to helper classes.

NEW QUESTION # 200

A developer is alerted to an issue with a custom Apex trigger that is causing records to be duplicated.

What is the most appropriate debugging approach to troubleshoot the issue?

- A. Add system.debug statements to the code to track the execution flow and identify the issue.
- B. Review the Historical Event logs to identify the source of the issue.
- C. Disable the trigger in production and test to see if the issue still occurs.
- D. Use the Apex Interactive Debugger to step through the code and identify the issue.

Answer: A

- A. Custom objects and fields
- B. Relationships
- C. Flows
- D. Roll-up summaries
- E. Triggers

Answer: A,B,D

NEW QUESTION # 202

```

Example 1:
AggregateResult[] groupedResults = [SELECT CampaignId, AVG(Amount) FROM Opportunity GROUP BY
CampaignId];
for (AggregateResult ar : groupedResults)
{
    System.debug('Campaign ID' + ar.get('CampaignId'));
    System.debug('Average amount' + ar.get('expr0'));
}

Example 2:
AggregateResult[] groupedResults = [SELECT CampaignId, AVG(Amount) theAverage FROM Opportunity
GROUP BY CampaignId];
for (AggregateResult ar : groupedResults)
{
    System.debug('Campaign ID' + ar.get('CampaignId'));
    System.debug('Average amount' + ar.get('theAverage'));
}

Example 3:
AggregateResult[] groupedResults = (SELECT CampaignId, AVG(Amount) FROM Opportunity GROUP BY
CampaignId);
for (AggregateResult ar : groupedResults)
{
    System.debug('Campaign ID' + ar.get('CampaignId'));
    System.debug('Average amount' + ar.get.AVG());
}

Example 4:
AggregateResult[] groupedResults = [SELECT CampaignId, AVG(Amount) theAverage FROM Opportunity
GROUP BY CampaignId];
for (AggregateResult ar : groupedResults)
{
    System.debug('Campaign ID' + ar.get('CampaignId'));
    System.debug('Average amount' + ar.theAverage);
}

```

Which two examples above use the system debug statements to correctly display the results from the SOQL aggregate queries?
Choose 2 answers

- A. Example 2
- B. Example 3
- C. Example 4
- D. Example 1

Answer: A,B

NEW QUESTION # 203

Provide question feedback here (optional):

```
Boolean isOK;
integer x;
String theString = 'Hello';

if (isOK == true && theString == 'Hello') {
    x = 1;
} else if (isOK == true && theString == 'Hello') {
    x = 2;
} else if (isOK != null && theString == 'Hello') {
    x = 3;
} else {
    x = 4;
}
```

Based on this code, what is the value of x?

- A. 0
- **B. 1**
- C. 2
- D. 3

Answer: B

Explanation:

The variable isOK is declared but not initialized, so its value is null. The if-else conditions check for specific values of isOK (true or false), but since it is null, none of those conditions are satisfied. The program defaults to the else block, assigning 4 to x.
