What is the Reason to Trust on Salesforce AP-202 Exam Questions?

With our AP-202 practice materials, you don't need to spend a lot of time and effort on reviewing and preparing. For everyone, time is precious. Office workers and mothers are very busy at work and home; students may have studies or other things. Using AP-202 guide torrent, you only need to spend a small amount of time to master the core key knowledge to pass the AP-202 Exam and get a AP-202 certificate. It is proved that if you spend 20 to 30 hours to study our AP-202 exam questions, it is easy for you to pass the AP-202 exam.

Salesforce B2B Commerce for Developers Accredited Professional Sample Questions (Q32-Q37):

NEW QUESTION # 32

An administrator has just provided a developer with a new org and username. Which two sets of steps can the developer use to authorize the org and begin deploying Lightning web components?

What should a developer do to expose a public property in a Lightning web component?

- A. Decorate the field with @api

- B. Decorate the field with @property
- C. Decorate the field with @public
- D. Decorate the field with @track

Answer: A

Explanation:

To expose a public property in a Lightning web component, the developer should decorate the field with the @api decorator. This decorator marks the property as public, which means that it can be set by another component, such as a parent component. The @api decorator also makes the property reactive, which means that any changes to the property value are reflected in the component's template. The other decorators (@property, @track, and @public) are not valid for exposing public properties in Lightning web components. B2B Commerce and D2C Commerce Developer Guide, [Lightning Web Components Developer Guide]

NEW QUESTION # 33

What are three advantages of using ccLog over the Salesforce standard System.debug class? (3 answers)

- A. There is no need to manually set a cookie to debug with the Site Guest User.
- B. Append #ccLog=<Logging Token Name> to the end of the storefront URL in order to get logs in the inspector console.
- C. There is no need to use string concatenation to easily tag log statements with a subject.
- D. ccLog can debug syntax errors found in the JavaScript.
- E. There is no need to create a User Trace Flag.

Answer: A,B,C

Explanation:

Three advantages of using ccLog over the Salesforce standard System.debug class are:

There is no need to use string concatenation to easily tag log statements with a subject. ccLog allows passing a subject parameter to the log method, which will prepend the subject to the log message. For example, ccLog.log('This is a message', 'Subject') will log[Subject] This is a message.

There is no need to create a User Trace Flag. ccLog can be enabled by setting the value of CO.logToken to true in CCAdmin, which will activate logging for all users who access the storefront.

There is no need to manually set a cookie to debug with the Site Guest User. ccLog can be enabled for the Site Guest User by appending #ccLog=<Logging Token Name> to the end of the storefront URL in order to get logs in the inspector console. For example, https://my-storefront.com/#ccLog=debug will enable logging for the Site Guest User with the debug level. Salesforce B2B Commerce and D2C Commerce Developer Guide, Logging

NEW QUESTION # 34

Universal Containers (UC) is ready to build a tax provider class using the interfaces available in the Buyer Experience SDK. When creating a tax provider, what are three things that a developer should consider first?

- A. Whether to use JSON or XML
- B. How to handle results
- C. Steps to complete in the Tax Service
- D. What to implement
- E. What events to fire in the Lightning web component

Answer: B,C,D

Explanation:

When creating a tax provider, three things that a developer should consider first are: steps to complete in the tax service, how to handle results, and what to implement. Steps to complete in the tax service are the actions that the developer needs to perform to connect to and use the third-party tax service provider's API or service. These steps may include authentication, authorization, request formatting, response parsing, error handling, and logging. How to handle results are the actions that the developer needs to perform to process and apply the tax calculation results from the tax service to the cart or order. These actions may include creating or updating cart items with type of Charge and charge type of Tax, applying tax adjustments or exemptions, and displaying tax amounts and details on the storefront. What to implement are the methods that the developer needs to define in their custom Apex class that implements the sfdc_checkout.TaxCalculations interface. The interface provides methods for customizing the tax

calculation logic for a cart or an order, such as `getTaxRatesAndRules`, `applyTaxAmountsAndAdjustments`, and `handleTaxErrorsAndExceptions`. Whether to use JSON or XML is not something that the developer should consider first, as it is not a critical or relevant factor for creating a tax provider. It may depend on the format that the tax service provider supports or prefers, but it does not affect the overall functionality or performance of the tax integration. What events to fire in the Lightning web component is not something that the developer should consider first either, as it is not related to creating a tax provider. It may be an optional feature that the developer can add to enhance the user interface or user experience of their storefront, but it does not affect the core logic or functionality of the tax integration. Salesforce B2B Commerce Developer Guide: Tax Integration, [B2B Commerce Developer Guide: Tax Calculations Interface]

NEW QUESTION # 35

A developer is setting up a storefront from scratch. They need to create a storefront, push store sources, create buyer users, import products, and create a search index.

Which command allows the developer to accomplish this task?

- A. `sfdx commerce:store:open -store-name test-store`
- B. `sfdx commerce:store:create -store-name test-store`
- C. `sfdx commerce:store:quickstart:setup -definitionfile store-scratch-def.json`
- D. `sfdx commerce:store:quickstart:create -templatename 'b2c-lite-storefront'`

Answer: C

Explanation:

The `sfdx commerce:store:quickstart:setup` command allows the developer to set up a store from scratch using a definition file that specifies the store configuration. This command performs the following tasks:

Pushes the store sources to the scratch org

Creates a buyer user

Imports products

Creates a search index

Opens the store in a browser

The other options are not correct because:

A) `sfdx commerce:store:quickstart:create` only creates a community for the store, but does not perform the other tasks required to set up a store from scratch.

C) `sfdx commerce:store:create` creates and sets up a store, but does not use a definition file to specify the store configuration. Instead, it uses command-line flags to provide the store parameters.

D) `sfdx commerce:store:open` only opens an existing store in a browser, but does not create or set up a store from scratch.

store Commands

Build a B2B and B2B2C Commerce Store

NEW QUESTION # 36

Which two components in a B2B store template should a developer use to customize a storefront page?

- A. Product List
- B. My Lists
- C. Order List
- D. Address List

Answer: A,B

Explanation:

Two components in a B2B store template that a developer can use to customize a storefront page are My Lists and Product List.

My Lists is a standard component that displays and manages lists of products that customers can create, save, or share in the storefront. A developer can use this component to enable customers to organize their favorite or frequently purchased products into lists and access them easily. Product List is a standard component that displays and filters products from one or more product lists in the storefront. A developer can use this component to showcase products from different categories or collections and allow customers to browse or search for products based on various criteria. Order List is not a component in a B2B store template, but rather an object that stores information about orders placed by customers in the storefront. Address List is not a component either, but rather an object that stores information about addresses associated with customers in the storefront.
