Salesforce Certified Development Lifecycle and Deployment Architect Sample Questions (Q41-Q46):

NEW QUESTION # 41
A year has passed since a project has gone live and a developer is looking to make an update to an existing Apex class, but is unsure of its purpose. What artifact from the original project should be leveraged to determine the purpose of the class?

- A. Requirements Traceability Matrix
- B. Test Execution Plan
- C. Test Sign Off Document
- D. User Acceptance Test Scripts

Answer: A

NEW QUESTION # 42
What are three advantages of the package development model?
Choose 3 answers

- A. Providing its own source control, so the source can be deployed In any sandbox orgs.
- B. Significantly reducing the need for manually tracking changes.
- C. Eliminating the need of using change set, which should no longer be used as it can get messy working with package development models.
- D. Improving team development and collaboration.
- E. Facilitating automated testing and continuous integration.

Answer: B,D,E

Explanation:
The advantages of the package development model are improving team development and collaboration, facilitating automated testing and continuous integration, and significantly reducing the need for manually tracking changes. The package development model allows the developers to work on modular and reusable components that can be easily tested and deployed. The package development model does not eliminate the need of using change sets, as they can still be used for deploying non-packaged components or metadata. The package development model does not provide its own source control, but rather relies on external source control systems such as Git.

NEW QUESTION # 43
Universal Containers (UC) has gone through a global organization restructuring and process review during the last year, which triggered a review of its Salesforce org strategy. After thorough analysis of its org and global customers, UC decided to start a project to merge its Salesforce orgs, going from a multi-org to a single-org strategy.
In this scenario, what are three benefits going to a single-org strategy?
Choose 3 answers

- A. Consolidating the business processes would be simplified.
- B. Improved Chatter collaboration across different business units.
- C. Easier to get a 360-view of the customer.
- D. Lower administration overhead costs.
- E. Automatically unify data model among all lines of business.

Answer: B,C,D

Explanation:
Explanation
Going to a single-org strategy can provide several benefits, such as lower administration overhead costs, improved Chatter collaboration across different business units, and easier to get a 360-view of the customer.
Consolidating the business processes and unifying the data model among all lines of business are not benefits of a single-org strategy, but rather challenges that need to be addressed during the org merge process.

NEW QUESTION # 44
Which two environments are appropriate for creating a managed package? Choose 2 answers

- A. Developer Pro Sandbox Org
- B. Production Org with LMA
- C. Partner Developer Edition Org
- D. Developer Edition Org

Answer: C,D

NEW QUESTION # 45
Universal Containers has a complex deployment coming up. The deployment will include several Apex classes which depend on custom settings that hold important configuration. How should an Architect manage this deployment?

- A. Manually deploy and populate custom settings in production using a change set
- B. Script the deployment of all functionality via the Force.com Migration Tool
- C. Create a custom metadata type and include this in your deployment to production
- D. Manually deploy and populate the custom settings in production prior to the Apex Class deployment

Answer: C

Explanation:
Explanation
C is the correct answer, as creating a custom metadata type and including this in your deployment to production is the best way to manage this deployment. A custom metadata type is a metadata component that can store important configuration data, such as custom settings, and can be deployed along with other components, such as Apex classes. A is incorrect, as scripting the deployment of all functionality via the Force.com Migration Tool is not a good way to manage this deployment, as it does not address the issue of deploying the custom settings that hold the configuration data. B is incorrect, as manually deploying and populating custom settings in production using a change set is not a good way to manage this deployment, as it can introduce errors and inconsistencies, as well as require additional steps and permissions. D is incorrect, as manually deploying and populating the custom settings in production prior to the Apex class deployment is not a good way to manage this deployment, as it can create dependency and timing issues, as well as require additional steps and permissions. You can learn more about this topic in the [Custom Metadata Types] module on Trailhead.
