Benefits Of Multiple Formats Of SAP C_BCBDC_2505 Exam Questions

As is known to us, a good product is not only reflected in the strict management system, complete quality guarantee system but also the fine pre-sale and after-sale service system. In order to provide the best C_BCBDC_2505 test training guide for all people, our company already established the integrate quality manage system, before sell serve and promise after sale. If you buy the C_BCBDC_2505 Exam Dumps from our company, we can make sure that you will have the right to enjoy the 24 hours full-time online service. In order to help the customers solve the problem at any moment, our server staff will be online all the time.

SAP C_BCBDC_2505 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">SAP Business Data Cloud: This section of the exam measures the skills of Data Analysts and covers core concepts of the SAP Business Data Cloud. Candidates are expected to understand its key components, integration mechanisms, and how it functions as a foundation for unified data management across SAP and non-SAP environments. The focus is on enabling data connectivity and providing governed access to data across the enterprise.
Topic 2	<ul style="list-style-type: none">SAP Datasphere: This section of the exam measures the skills of Solution Consultants and covers a comprehensive understanding of SAP Datasphere. Candidates should demonstrate knowledge of data modeling, transformation, and harmonization using SAP Datasphere tools. It evaluates how well they can work with data layer structuring, semantic modeling, and integration to support real-time data access for various business applications.

Topic 3	<ul style="list-style-type: none"> • SAP Analytics Cloud: This section of the exam measures the skills of Data Analysts and covers the use of SAP Analytics Cloud in data visualization, story building, and dashboard creation. Candidates should be familiar with its planning and predictive capabilities, along with how to utilize data insights to drive business decision-making. It also includes managing user access and collaborating through shared analytics assets.

SAP Certified Associate - SAP Business Data Cloud Sample Questions (Q11-Q16):

NEW QUESTION # 11

What do you use to write data from a local table in SAP Datasphere to an outbound target?

- A. CSN Export
- **B. Data Flow**
- C. Replication Flow
- D. Transformation Flow

Answer: B

Explanation:

To write data from a local table in SAP Datasphere to an outbound target, you primarily use a Data Flow. A Data Flow in SAP Datasphere is a powerful tool designed for comprehensive data integration and transformation. It allows you to extract data from various sources (including local tables within Datasphere), perform various transformations (like joins, aggregations, filtering, scripting), and then load the processed data into a specified target. This target can be another local table, a remote table, or an outbound target like an external database or a file system. While a Replication Flow (C) is used for ingesting data into Datasphere, and a Transformation Flow (A) is not a standalone artifact for outbound writes (often part of a Data Flow), the Data Flow provides the complete framework for extracting, transforming, and loading data, including sending it to external destinations.

NEW QUESTION # 12

Which of the following options will duplicate data to SAP HANA cloud under SAP Datasphere, based on data from an external source object?

There are 3 correct answers to this question.

Response:

- A. Create a graphical view based on a remote table for that source object and persist the view data
- **B. Import a source as a remote table and schedule replication**
- **C. Use a replication flow to fill a local table**
- D. Import a source as a remote table without taking any further action
- **E. Use a data flow to fill a target table**

Answer: B,C,E

NEW QUESTION # 13

Which options do you have when using the remote table feature in SAP Datasphere? Note: There are 3 correct answers to this question.

- **A. Data can be persisted by using real-time replication.**
- B. Data access can be switched from virtual to persisted, but not the other way around.
- **C. Data can be accessed virtually by remote access to the source system**
- D. Data can be loaded using advanced transformation capabilities.
- **E. Data can be persisted in SAP Datasphere by creating a snapshot (copy of data).**

Answer: A,C,E

Explanation:

The remote table feature in SAP Datasphere offers significant flexibility in how data from external sources is consumed and managed. Firstly, data can be accessed virtually by remote access to the source system (E). This means Datasphere does not store a

copy of the data; instead, it queries the source system in real-time when the data is requested. This ensures that users always work with the freshest data. Secondly, data can be persisted in SAP Datasphere by creating a snapshot (copy of data) (C). This allows users to explicitly load a copy of the remote table's data into Datasphere at a specific point in time, useful for performance or offline analysis. Lastly, data can be persisted by using real-time replication (D). For certain source systems and configurations, Datasphere supports continuous, real-time replication, ensuring that changes in the source system are immediately reflected in the persisted copy within Datasphere. Option A is incorrect as the access mode cannot be arbitrarily switched, and option B refers to data flow capabilities, not inherent remote table access options.

NEW QUESTION # 14

In an SAP Analytics Cloud planning data model, which dimensions are included by default? Note: There are 2 correct answers to this question.

- A. Version
- B. Organization
- C. Date
- D. Entity

Answer: A,C

Explanation:

When creating a planning data model in SAP Analytics Cloud (SAC), certain dimensions are included by default to facilitate common planning scenarios. The two key dimensions automatically present are Version and Date. The Version dimension is crucial for distinguishing between different planning scenarios, such as "Actual," "Budget," "Forecast," or "Plan 2025," allowing users to compare and manage various iterations of their planning data. The Date dimension, on the other hand, is essential for time-based planning and analysis, enabling data entry, aggregation, and reporting across different time granularities like years, quarters, months, or days. These default dimensions provide a robust framework for financial and operational planning, serving as foundational elements around which planning activities are structured, and ensuring consistency and comparability across different planning versions and time periods.

NEW QUESTION # 15

Which data source does not require a model be created for it in SAP Analytics Cloud for use in stories?

Please choose the correct answer.

Response:

- A. SAP Business Warehouse (BW)
- B. Microsoft SharePoint
- C. SAP Datasphere

Answer: C

NEW QUESTION # 16
