WGU Managing Cloud Security (JY02) Sample Questions (Q96-Q101):

NEW QUESTION # 96

Which action should a customer take to add an extra layer of protection to the data stored in a public cloud environment?

- A. Use web application firewalls (WAFs)
- **B. Use additional encryption for sensitive files and folders**
- C. Use block storage instead of file storage
- D. Use database activity monitoring (DAM)

Answer: B

Explanation:

While cloud providers typically offer built-in encryption, customers should apply additional encryption for sensitive data to maintain defense-in-depth. Encrypting files and folders before uploading them ensures that even if provider-side protections fail, data remains

confidential.

WAFs protect applications from web threats, DAM tools monitor database use, and block storage versus file storage is an architecture choice. None of these directly provide an extra protective layer for stored data.

By maintaining control of their encryption keys, customers ensure compliance with data protection standards such as GDPR, HIPAA, or PCI DSS. This practice also mitigates insider threats within the provider's environment and supports secure multi-cloud strategies. Encryption remains the strongest safeguard for protecting sensitive files in public cloud storage.

NEW QUESTION # 97

What is a risk in using the community cloud over the private cloud?

- A. Loss of trained personnel
- B. Lack of physical resources
- C. Loss of policy control
- D. Lack of virtual instances

Answer: C

Explanation:

A loss of policy control is a key risk when using a community cloud compared to a private cloud. Managing Cloud principles explain that community clouds are shared by multiple organizations with common objectives, compliance needs, or industry requirements. Because governance is shared across participants, individual organizations may have reduced ability to enforce customized security policies, configurations, or controls. Policy decisions often require consensus, which can limit flexibility and slow response to emerging risks.

Private clouds provide full control over governance, security policies, and configurations. The other options are not inherent risks of community cloud models. Therefore, loss of policy control is the correct answer.

NEW QUESTION # 98

Which section of a contract includes the customer's right to audit the vendor to verify whether the vendor is fulfilling its contractual obligations?

- A. Litigation
- B. Termination
- C. Indemnification
- D. Assurance

Answer: D

Explanation:

The Assurance section of a contract specifies the customer's rights to verify that the vendor is meeting contractual and compliance obligations. This often includes the right to audit, request independent certifications, or require compliance reports such as SOC 2 or ISO 27001.

Indemnification deals with liability coverage, termination outlines exit conditions, and litigation describes dispute resolution mechanisms. None of these provide the customer with ongoing oversight rights.

Audit rights are critical in cloud contracts to maintain transparency, enforce accountability, and verify that shared responsibility is being upheld. Assurance provisions give customers confidence in the provider's security and operational practices, ensuring compliance with industry regulations.

NEW QUESTION # 99

An organization wants to secure the boundary between a lower-security zone and a higher-security zone.

Which security measure should it use?

- A. Bastion host
- B. Host isolation
- C. Virtual client
- D. Secure Shell

Answer: A

Explanation:

Bastion hosts are hardened systems placed at the boundary between different security zones. They act as gateways, controlling access from a less secure network (such as the internet or a lower-trust zone) into a higher-security zone (such as an internal cloud environment).

Secure Shell (SSH) provides secure communication but does not create a boundary. Virtual clients and host isolation are endpoint measures, not boundary defenses.

By placing a bastion host at the perimeter, organizations centralize monitoring, apply strict access controls, and reduce attack surfaces. These hosts are typically stripped down to essential services, patched frequently, and monitored closely. In cloud environments, bastion hosts are essential for controlling administrative access while enforcing strong authentication and logging.

NEW QUESTION # 100

Which general body of law covers data breach violations in a cloud environment at a federal agency?

- A. Civil
- B. Tort
- C. Administrative
- D. Criminal

Answer: C

Explanation:

Administrative law governs data breach violations involving federal agencies in cloud environments.

Managing Cloud principles explain that administrative law regulates the activities of government agencies and defines compliance obligations, enforcement actions, and penalties.

When a federal agency experiences a data breach, violations are typically addressed through administrative processes rather than criminal or civil courts. Oversight bodies evaluate compliance with federal regulations, policies, and standards, and corrective actions may be mandated.

Criminal law addresses offenses against the state, civil law governs disputes between parties, and tort law covers personal injury claims. Therefore, administrative law is the correct body of law for federal agency data breaches.
