Our 156-315.81 test material is known for their good performance and massive learning resources. In general, users pay great attention to product performance. After a long period of development, our 156-315.81 research materials have a lot of innovation. And we also take the feedback of users who use the Check Point Certified Security Expert R81 exam guide materials seriously. Once our researchers find that these recommendations are possible to implement, we will try to refine the details of the 156-315.81 Quiz guide. Our 156-315.81 quiz guide has been seeking innovation and continuous development.

CheckPoint Check Point Certified Security Expert R81 Sample Questions (Q517-Q522):

NEW QUESTION # 517

SandBlast offers flexibility in implementation based on their individual business needs. What is an option for deployment of Check Point SandBlast Zero-Day Protection?

- A. Public Cloud Services
- B. Load Sharing Mode Services
- C. Smart Cloud Services
- D. Threat Agent Solution

Answer: C

Explanation:

Check Point SandBlast Zero-Day Protection offers flexibility in implementation to meet individual business needs. One of the deployment options for Check Point SandBlast Zero-Day Protection is:

Smart Cloud Services (Option A): Smart Cloud Services allow organizations to leverage cloud-based threat intelligence and protection services provided by Check Point.

The other options, Load Sharing Mode Services (Option B), Threat Agent Solution (Option C), and Public Cloud Services (Option D), may also be components of a security strategy, but they are not specific deployment options for Check Point SandBlast Zero-Day Protection.

NEW QUESTION # 518

Which command will allow you to see the interface status?

- A. cphaprob -a if
- B. cphaprob -I interface
- C. cphaprob stat
- D. cphaprob interface

Answer: A

NEW QUESTION # 519

How do you enable virtual mac (VMAC) on-the-fly on a cluster member?

- A. cphaprob set int fwha_vmac_global_param_enabled 1
- B. clusterXL set int fwha_vmac_global_param_enabled 1
- C. fw ctl set int fwha_vmac_global_param_enabled 1
- D. cphaconf set int fwha_vmac_global_param_enabled 1

Answer: C

Explanation:

To enable VMAC mode on a cluster member, you need to set the value of the global kernel parameter

fwha_vmac_global_param_enabled to 1. This can be done on-the-fly using the command fw ctl set int fwha_vmac_global_param_enabled 1 on all cluster members. This command does not require a reboot or a policy installation. VMAC mode allows the cluster to use a virtual MAC address for its virtual IP addresses, which reduces the number of gratuitous ARP packets sent upon failover and avoids ARP cache issues on some routers and switches. References: How to enable ClusterXL Virtual MAC (VMAC) mode

NEW QUESTION # 520

How would you deploy TE250X Check Point appliance just for email traffic and in-line mode without a Check Point Security Gateway?

- A. It is not possible, always Check Point SGW is needed to forward emails to SandBlast appliance.
- B. Install appliance TE250X on SpanPort on LAN switch in MTA mode.
- **C. You can utilize only Check Point Cloud Services for this scenario.**
- D. Install appliance TE250X in standalone mode and setup MTA.

Answer: C

Explanation:

Explanation

To deploy a TE250X Check Point appliance just for email traffic and in-line mode without a Check Point Security Gateway, you can utilize Check Point Cloud Services. In this scenario, you can leverage cloud-based email security services provided by Check Point without the need for an on-premises Security Gateway.

Option C correctly states that you can use only Check Point Cloud Services for this scenario, making it the verified answer.

NEW QUESTION # 521

Session unique identifiers are passed to the web api using which http header option?

- A. Application
- B. Proxy-Authorization
- **C. X-chkp-sid**
- D. Accept-Charset

Answer: C

Explanation:

Explanation

Session unique identifiers are passed to the web API using the X-chkp-sid HTTP header option. The web API is a service that runs on the Security Management Server and enables external applications to communicate with the Check Point management database using REST APIs. To use the web API, you need to create a session with the management server by sending a login request with your credentials. The management server will respond with a session unique identifier (SID) that represents your session. You need to pass this SID in every subsequent request to the web API using the X-chkp-sid HTTP header option. This way, the management server can identify and authenticate your session and perform the requested operations.
