They constantly use their industry experiences to provide the precise logic verification. The ClaimCenter-Business-Analysts prep material is compiled with the highest standard of technology accuracy and developed by the certified experts and the published authors only.

### Guidewire ClaimCenter Business Analyst - Mammoth Proctored Exam Sample Questions (Q10-Q15):

#### NEW QUESTION # 10

Whenever the Total Loss Calculator determines that a vehicle is a total loss, Succeed Insurance wants to create a custom history event with the exposure name and total loss score.

Which step in the claim setup process flow must be completed before the history event can be created?

- A. Add a new step after the Vehicle Incident step to create the history event.
- B. Add a new step before the Vehicle Incident step to create the history event.
- C. Add a new step after the Total Loss Calculator to create the history event.
- D. Add a new step before the Total Loss Calculator to create the history event.

**Answer: C**

Explanation:

250 to 350 words From Exact Extract of Guidewire ClaimCenter Business Analyst documentation:

In Guidewire ClaimCenter workflow analysis and configuration, defining the correct sequence of operations is critically dependent on Data Availability and Data Dependency.

The specific requirement here dictates that the custom history event must capture the Total Loss Score. In the context of the ClaimCenter object model and process flow, the Total Loss Score is an output value generated specifically by the Total Loss Calculator engine. Before this calculator runs, the score attribute is effectively null or non-existent.

Therefore, to satisfy the business requirement, the step that writes the history event must be placed after the step that generates the data it needs to record.

\* Process Logic: If the Business Analyst were to place the history event creation step before the Total Loss Calculator (Option B) or before the Vehicle Incident (Option D), the system would attempt to write a record containing a score that has not yet been calculated. This would result in either a system error or a history event with a blank/zero value, failing to meet the business requirement.

\* Dependency Chain: The workflow dependency is: Vehicle Data Entry -> Total Loss Calculation -> Score Generation -> History Event Creation.

\* Implementation Note: In a typical Guidewire implementation, this logic is often handled via "Event Fired" rules or specific "Exit Points" in the workflow. The system waits for the confirmation that the Total Loss calculation service has successfully returned a result. Once that transaction is committed and the score is persisted on the Vehicle or Exposure entity, the subsequent rule to generate the History Event can trigger successfully.

Consequently, Option C is the only viable placement in the process flow. It ensures that the prerequisite action (calculation) is complete and the required data payload (the score) is available for the subsequent action (logging the history event).

#### NEW QUESTION # 11

Which workflow will kick in if the claim assignment is handled via "Default Group Claim Assignment Rule" with available matching?

- A. Claim gets assigned to an appropriate Group based on geography and LOB.

- B. Claim gets assigned to a user based on expertise and workload.
- C. Claim goes to the "Root Group" for manual assignment.
- D. Claim gets assigned to a Supervisor to determine next step.

**Answer: B**

Explanation:

In Guidewire ClaimCenter, assignment logic functions in a two-stage process: first Global Assignment (which finds the appropriate Group) and then Group Assignment (which finds the appropriate User within that group).

1

The Default Group Claim Assignment Rule is the specific logic set used to distribute claims within a group once the group has already been identified. When this rule is configured with "available matching" (often referred to as criteria-based or attribute-based assignment), the system evaluates the users inside that group against specific criteria.

\* Workflow: The system filters the group's users to find those who are "available" (not on vacation) and then matches the claim against user attributes such as Expertise, Workload (current claim count), or specific skills.

\* Result: The claim is automatically assigned to the best-fit User within that group.

Why other options are incorrect:

\* Option B (Geography/LOB): This describes Global Assignment rules, which are responsible for routing the claim to the correct office or unit (Group), not the specific user.

\* Option C (Supervisor): Assigning to a supervisor is a fallback mechanism (often called "Assign to Supervisor") used when the system fails to find a matching user or when manual intervention is explicitly required. It is not the primary function of "available matching."

\* Option D (Root Group): Routing to the "Root Group" is a last-resort fallback when Global Assignment fails entirely to find any appropriate group.

## NEW QUESTION # 12

To help manage new user setup, Succeed Insurance would like all manager-level employees to be able to add new users to ClaimCenter. Some managers are already assigned the Community Admin role, which has a set of permissions for the administration of the ClaimCenter community model that includes the permission to create new users.

Where are two places the Business Analyst (BA) can go to view the permissions assigned to manager-level users? (Choose two.)

- A. Go to the Administration menu > Users & Security > Authority Limits
- B. Go to c:\GW10\ClaimCenter\build\dictionary\data\index.html to view the Data Dictionary
- C. Go to c:\GW10\ClaimCenter\build\dictionary\security\index.html to view the Security Dictionary
- D. Go to the Administration menu > Users & Security > Roles
- E. Go to the Administration menu > Users & Security > Users

**Answer: C,D**

Explanation:

To view the detailed System Permissions (such as usercreate, claimview, etc.) associated with a specific user role (like "Manager" or "Community Admin"), a Business Analyst has two primary methods: one within the application UI and one via generated documentation.

\* Administration Menu > Users & Security > Roles (Option E): This is the direct User Interface method. By navigating to the Roles page in the Administration tab, the BA can select a specific role (e.

g., "Manager"). The detailed view of that role lists every system permission currently granted to it. This allows the BA to verify if the "usercreate" permission is present.

\* Security Dictionary (Option B): For a comprehensive, searchable, and offline reference, the BA can access the Security Dictionary. This is a set of HTML files generated from the application's configuration (found in the build directory). It provides a complete matrix of all Roles, the Permissions assigned to them, and the Access Profiles configured in the system.

Why other options are incorrect:

\* Data Dictionary (A): This documents the Data Model (Entities and Typelists), not the security configuration.

\* Users (C): While this screen lists users and their assigned roles, it does not display the definitions (the specific list of permissions) of those roles.

\* Authority Limits (D): This screen manages Financial limits (dollar amounts for reserves/payments), not system access permissions.

## NEW QUESTION # 13

Succeed Insurance had an embarrassing event last month that had potential legal ramifications. One of their Customer Service

Representatives (CSR) shared details of a celebrity's personal auto claim on social media.

Fortunately for Succeed, the celebrity decided not to pursue legal actions as long as Succeed agreed to resolve the potential for future occurrences within the next 30 days.

Succeed executives immediately reacted to the situation by establishing new guidelines regarding claim security. The Business Analyst (BA) assigned to the project researched ClaimCenter base product capabilities and held several requirements gathering sessions designed to document their strategy. The new requirements indicate that only authorized users should be looking at celebrity claims.

Which two features should be used to meet the new requirements? (Choose two.)

- A. Create a rule that tracks who has viewed secure claims
- **B. Create an access profile for each claim security level**
- C. Assign authority profiles to authorized users
- D. Hide secure claim information fields
- **E. Specify the claim security types**

**Answer: B,E**

Explanation:

To restrict access to sensitive claims (such as those involving celebrities) so that "only authorized users" can view them, a Business Analyst must utilize the Claim Security features in Guidewire.

\* Specify Claim Security Types (Option A): The first step is to define the classification of the claim.

The system uses the ClaimSecurityType typelist. The BA would add a new typekey (e.g., "Celebrity" or "High Profile") or use an existing one (e.g., "Sensitive") to flag these specific claims.

\* Create/Assign Access Profiles (Option E): Access control in Guidewire is managed through Access Profiles (sometimes referred to within Role configurations). An Access Profile maps specific Security Levels (like the "Celebrity" type defined above) to permissions. To meet the requirement, the BA defines an Access Profile that grants "View" permission for the "Celebrity" security type and assigns this profile only to the authorized users (or roles). Users without this specific Access Profile will be unable to search for or view the claim.

Why other options are incorrect:

\* Authority Profiles (B): In Guidewire terminology, "Authority" refers strictly to Financial Authority (limits on reserves and payments), not data access visibility.

\* Hide secure fields (C): This refers to Field Level Security (masking specific data like a Tax ID). The requirement is to restrict access to the entire claim, not just specific fields.

\* Tracking rules (D): While "Claim Access Auditing" (tracking history) is often enabled for sensitive claims, it is a detective control, not a preventive one. The requirement specifies that unauthorized users should not be looking at the claim at all, which requires the Access Profiles (preventive control).

#### **NEW QUESTION # 14**

Satisfied with the outcome of a Requirements Workshop, a Business Analyst (BA) attributed the success to preparation. The assigned task had been to document the requirements for capturing details on vehicle incidents for Personal Auto.

\* Before the session, the BA reviewed ClaimCenter functionality by creating a new Personal Auto Claim involving physical damage to a vehicle.

\* During review, the BA saw that ClaimCenter did not have a graphical representation of a vehicle with clickable hot spots to identify the damage areas like they have in their current application.

\* Upon further research, the BA found that Guidewire does offer this functionality and even provides a Graphical Incident Capture Accelerator to ease implementation.

\* During the workshop, the BA was able to clearly present all options for capturing vehicle incident details. Instead of having to develop the Vehicle Incident Capture functionality from scratch, the team was able to make a quick decision to add this functionality and end the meeting 30 minutes early.

Which two outcomes demonstrate the importance of preparing for a Requirements Workshop by becoming familiar with the features and functionality of ClaimCenter? (Choose two.)

- A. The BA was able to gain team acceptance of the base product process instead of the legacy system process.
- B. The BA was able to make decisions in advance about where gaps existed and where changes were needed.
- **C. The BA was able to compare their legacy process to how ClaimCenter handles the same business process.**
- **D. The BA prevented the team from rebuilding something in a less effective way.**

**Answer: C,D**

Explanation:

This scenario highlights the value of Feature Knowledge and Gap Analysis during preparation.

\* Prevention of unnecessary work (Option A): Because the BA researched and found the "Graphical Incident Capture Accelerator," the team avoided the costly mistake of deciding to "develop the...

functionality from scratch." This is a direct outcome of the BA's preparation preventing an inefficient custom build.

\* Comparison of Legacy vs. New (Option B): The text details that the BA "reviewed ClaimCenter functionality" and explicitly noted the difference ("saw that ClaimCenter did not have... like they have in their current application"). This ability to articulate the gap between the As-Is (Legacy) and the To-Be (Base ClaimCenter) allowed the BA to present the Accelerator as the perfect bridge solution.

Why other options are incorrect:

\* Option C: The team did not accept the "base product process" (which lacked the graphics); they accepted the Accelerator (an add-on) to match the legacy expectation of clickable hot spots.

\* Option D: The decision was not made "in advance." The text states the team made the "quick decision" during the workshop. The preparation enabled the team's decision, but the BA did not make it unilaterally beforehand.

## NEW QUESTION # 15

.....

Passing the ClaimCenter Business Analyst - Mammoth Proctored Exam (ClaimCenter-Business-Analysts) certification is crucial for those who want to excel in the Guidewire industry. However, one of the biggest challenges that individuals face after deciding to take the ClaimCenter Business Analyst - Mammoth Proctored Exam (ClaimCenter-Business-Analysts) exam is finding authentic ClaimCenter-Business-Analysts questions for efficient preparation. Those who do not study with real ClaimCenter Business Analyst - Mammoth Proctored Exam (ClaimCenter-Business-Analysts) dumps often fail the test and waste their valuable resources.
