WGU Scripting and Programming Foundations Exam Sample Questions (Q69-Q74):

NEW QUESTION # 69

Review the following sequence diagram:

What does a sequence diagram do?

- A. Shows interactions and indicates an order of events
- B. Shows static elements of software
- C. Shows interactions but does not specify an order of events
- D. Shows an order of events but does not specify all interactions

Answer: A

Explanation:

A sequence diagram is a type of interaction diagram used in software engineering to model the interactions between objects within a system over time. It shows how objects interact with each other and the order in which those interactions occur. The sequence diagram is organized along two dimensions: horizontally to represent the objects involved, and vertically to represent the time sequence of interactions. This allows the diagram to depict not only the interactions but also the sequence of events as they occur over time¹²³⁴⁵.

Option B is incorrect because a sequence diagram does indeed specify an order of events. Option C is incorrect as sequence diagrams do not show static elements of software but rather the dynamic interactions. Option D is also incorrect because a sequence diagram does show all interactions along with their order.

References: The purpose and structure of sequence diagrams are well-documented in various educational resources, such as Visual Paradigm¹, Creately's guide², and Wikipedia³. These sources provide detailed explanations and examples of sequence diagrams, confirming their use in displaying interactions and the order of events.

NEW QUESTION # 70

Which snippet represents the loop variable update statement in the given code?

```
integer h = 7
while h < 30
Put h to output
h = h + 2
```

- A. h < 30
- B. h = h + 2
- C. integer h = 7

- D. Put h to output

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

A loop variable update statement changes the value of the loop variable to progress the loop toward termination. In a while loop, this typically occurs within the loop body. According to foundational programming principles, the update statement modifies the loop control variable (here, h).

* Code Analysis:

- * integer h = 7: Initializes h (not an update).
- * while h < 30: Loop condition (not an update).
- * Put h to output: Outputs h (not an update).
- * h = h + 2: Updates h by adding 2, progressing the loop.
- * Option A: "h < 30." Incorrect. This is the loop condition, not an update.
- * Option B: "h = h + 2." Correct. This statement updates the loop variable h, incrementing it by 2 each iteration.
- * Option C: "Put h to output." Incorrect. This is an output statement, not an update.
- * Option D: "integer h = 7." Incorrect. This is the initialization, not an update.

NEW QUESTION # 71

Which data type should be used to hold the value of a person's body temperature in Fahrenheit?

- A. String
- B. Boolean
- C. Integer
- **D. Float**

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Body temperature in Fahrenheit typically includes decimal precision (e.g., 98.6°F). According to foundational programming principles, a floating-point type is suitable for values with decimal components.

* Option A: "Integer." This is incorrect. Integers cannot store decimal values, and body temperature often requires precision (e.g., 98.6 # 99).

* Option B: "String." This is incorrect. While a string could store "98.6" as text, it's not suitable for numerical calculations (e.g., averaging temperatures).

* Option C: "Float." This is correct. A floating-point type (float) can store decimal values like 98.6, making it ideal for body temperature. For example, in C: float temp = 98.6;

* Option D: "Boolean." This is incorrect. Booleans store true/false values, not numerical temperatures.

NEW QUESTION # 72

A programming is developing an application that needs to manipulation text in a variety of ways. Everything the programmer needs is standard in the industry and the programmer wants to perform these manipulations with a minimal amount of code. What does the programmer need?

- A. A function
- B. An algorithm
- C. A script
- **D. A programming library**

Answer: D

Explanation:

In the context of text manipulation, a programming library is a collection of pre-written code that provides standard functions and procedures to perform common tasks. This allows programmers to perform text manipulations with a minimal amount of code, as they can leverage the functions provided by the library instead of writing everything from scratch. Libraries often include functions for string handling, such as searching, splitting, joining, and formatting strings, which are standard requirements in many applications1234.

NEW QUESTION # 73

Which expression evaluates to 14 if integer y = 13?

- A. $11.0 - y / 5$
- **B. $11 + y \% 5$**
- C. $(11 + y) \% 5$
- D. $11 - y / 5.0$

Answer: B

Explanation:

To find an expression that evaluates to 14 when y = 13, let's evaluate each option:

A: $11 + y \% 5$: The modulo operation (%) gives the remainder after division. For y = 13, $13 \% 5$ equals 3.

Adding 11 to 3 results in 14, so this expression is correct.

B: $11 - y / 5.0$: Dividing 13 by 5.0 gives 2.6. Subtracting 2.6 from 11 does not yield 14, so this expression is incorrect.

C: $(11 + y) \% 5$: Adding 11 to 13 results in 24. Taking the modulo of 24 with 5 gives 4, which is not equal to 14. Therefore, this expression is incorrect.

D: $11.0 - y / 5$: Dividing 13 by 5 gives 2.6. Subtracting 2.6 from 11.0 does not yield 14, so this expression is incorrect.

The correct expression is A. $11 + y \% 5$.
