

Benefits of the ExamDiscuss Salesforce Integration-Architect Exam Questions

BONUS!!! Download part of ExamDiscuss Integration-Architect dumps for free: <https://drive.google.com/open?id=19dky2dd-GnZedWoEmYNJyolmXnwUTX0->

For there are some problems with those still in the incubation period of strict control, thus to maintain the Integration-Architect quiz guide timely, let the user comfortable working in a better environment. You can completely trust the accuracy of our Salesforce Integration-Architect Exam Questions because we will full refund if you failed exam with our training materials.

Salesforce Integration-Architect Certification Exam covers a wide range of topics, including integration patterns, data modeling, security, and performance optimization. Integration-Architect exam is divided into two parts: a multiple-choice section and a scenario-based section. The multiple-choice section tests your knowledge of Salesforce integration concepts and best practices, while the scenario-based section evaluates your ability to apply these concepts to real-world scenarios.

Integration-Architect Latest Braindumps Book | Integration-Architect Latest Exam Experience

The contents of Integration-Architect study materials are all compiled by industry experts based on the Integration-Architect examination outlines and industry development trends over the years. It does not overlap with the content of the Integration-Architect question banks on the market, and avoids the fatigue caused by repeated exercises. Our Integration-Architect Exam Guide is not simply a patchwork of exam questions, but has its own system and levels of hierarchy, which can make users improve effectively.

Salesforce Integration-Architect Certification Exam is a valuable certification for integration architects who want to demonstrate their expertise in designing and implementing complex integration solutions using the Salesforce platform. Salesforce Certified Integration Architect certification helps integration architects to differentiate themselves in the job market, opens up new career opportunities, and helps organizations to identify and hire qualified integration architects. If you're an integration architect looking to validate your skills and expertise in Salesforce integration, the Salesforce Integration-Architect Certification Exam is the perfect certification for you.

Salesforce Certified Integration Architect Sample Questions (Q29-Q34):

NEW QUESTION # 29

Universal Containers (UC) is a leading provider of management training globally, UC embarked on a Salesforce transformation journey to allow students to register for courses in the Salesforce community. UC has a learning system that masters all courses and student registration.

UC requested a near real-time feed of student registration from Salesforce to the learning system. The integration architect

recommends using Salesforce event.

Which API should be used for the Salesforce platform event solution?

- A. SOAP API
- B. O REST AP
- **C. Streaming API**
- D. Tooling API

Answer: C

NEW QUESTION # 30

A company wants to standardize exception tracking, handling, and analytics. Given the following actions:

1. Build a companywide logging service hosted on a middleware platform
2. Create case object records for exceptions-based thresholds
3. Change all their Apex Loggers to publish Application Exceptions as custom Platform Events.

Which two specifications should the integration architect include in the logging service architecture?

Choose 2 answers

- A. Subscribe to the Application Exceptions using the Salesforce Streaming API.
- **B. Create Salesforce Cases using the Salesforce REST, SOAP or Bulk API.**
- C. Receive Application Events through Change Data Capture (CDC).
- **D. Create Salesforce Cases conditionally using automatic Case creation rules.**

Answer: B,D

Explanation:

Creating Salesforce Cases using the Salesforce REST, SOAP or Bulk API is a solution that can allow the logging service to create case records in Salesforce based on the exceptions received from the middleware platform. This way, the logging service can use the standard APIs to interact with Salesforce and leverage the features and functionality of the case object. Creating Salesforce Cases conditionally using automatic Case creation rules is a solution that can allow the logging service to create case records in Salesforce based on predefined criteria and actions. This way, the logging service can reduce the number of API calls and avoid creating unnecessary or duplicate cases. Receiving Application Events through Change Data Capture (CDC) is not a solution that is related to this requirement, as CDC is used for capturing data changes in Salesforce and sending them to external systems, not for receiving data from external systems. Subscribing to the Application Exceptions using the Salesforce Streaming API is also not a solution that is related to this requirement, as Streaming API is used for subscribing to events or notifications from Salesforce, not for sending data to Salesforce. NEW QUESTION # 31

An Integration Architect has designed a mobile application for Salesforce users to get data while on the road using a custom UI. The application is secured with OAuth and is currently functioning well. There is a new requirement where the mobile application needs to obtain the GPS coordinates and store it on a custom geolocation field.

The geolocation field is secured with Field Level Security, so users can view the value without changing it.

What should be done to meet the requirement?

- **A. The mobile device makes a REST Apex inbound call.**
- B. The mobile device makes a REST API inbound call.
- C. The mobile device makes a SOAP API inbound call. The mobile device receives a REST Apex callout call.

Answer: A

Explanation:

The mobile device should make a REST Apex inbound call to meet the requirement. A REST Apex inbound call allows the mobile device to invoke custom Apex logic on Salesforce using a RESTful interface. The Apex logic can then access the geolocation field using the user's OAuth token and update it with the GPS coordinates from the mobile device. The geolocation field is secured with Field Level Security, so the user can view the value without changing it. A SOAP API inbound call or a REST API inbound call would not be able to access the custom geolocation field, as they are not supported by the standard Salesforce objects and fields. NEW QUESTION # 32

The URL for an external service has been changed without prior notice. The service provides up to date money exchange rates that is accessed several times from Salesforce and is a business critical function for end users.

Which two solutions should an Integration Architect recommend be implemented to minimize potential downtime for users in this situation?

Choose 2 answers

- A. Enterprise ESB
- B. Content Security Policies
- C. Remote Site Settings
- D. Named Credentials

Answer: A,D

Explanation:

The best solutions for minimizing potential downtime for users in this situation are to use named credentials and an enterprise ESB. Named credentials allow you to store the URL and authentication parameters of an external service in one definition, and then use it in Apex callouts or declarative integrations. If the URL of the external service changes, you only need to update the named credential once, and all the integrations that use it will be updated automatically. An enterprise ESB is a middleware layer that acts as a broker between different systems and services. It can provide routing, transformation, orchestration, and monitoring capabilities for integrations. If the URL of an external service changes, you only need to update the ESB configuration once, and all the integrations that use it will be updated automatically. Option B is not correct because remote site settings only allow you to specify the domains that are allowed for callouts from your org.

They do not store any authentication parameters or provide any routing or transformation capabilities. Option C is not correct because content security policies are used to control what resources can be loaded on a Visualforce or Lightning page. They do not store any authentication parameters or provide any routing or transformation capabilities. References:

NamedCredentials

Streamline and Secure: Mastering Named Credentials in Salesforce

NEW QUESTION # 33

Northern Trail Outfitters requires an integration to be set up between one of their Salesforce orgs and an external data source via Salesforce Connect. The external data source supports Open Data Protocol.

Which three configurations should an Integration Architect recommend be implemented in order to secure requests coming from Salesforce?

Choose 3 answers

- A. Configure CSRF Protection on External Data Source.
- B. Configure a Certificate for OData connection.
- C. Configure CSRF Protection for OData connection.
- D. Configure Special Compatibility for OData connection.
- E. Configure Identity Type for OData connection.

Answer: B,C,E

Explanation:

Explanation

Configuring Identity Type, Certificate, and CSRF Protection for OData connection are three configurations that an Integration Architect should recommend to secure requests coming from Salesforce. Identity Type is used to specify the authentication method for the OData connection, such as Basic Authentication, OAuth 2.0, or Named Principal. Certificate is used to enable SSL/TLS encryption for the OData connection, which protects the data in transit from eavesdropping or tampering. CSRF Protection is used to prevent cross-site request forgery attacks, which exploit the trust between the user and Salesforce by sending malicious requests from another website. Configuring Special Compatibility for OData connection is not a configuration that is related to security, but rather to compatibility issues with different versions or implementations of OData.

Configuring CSRF Protection on External Data Source is not a configuration that can be done in Salesforce, but rather on the external data source itself. Reference: Salesforce Connect: Custom Adapters Developer Guide, page 9-10
