CompTIA Cloud+ (2024) Sample Questions (Q200-Q205):

NEW QUESTION # 200

A cloud solutions architect is designing a VM-based solution that requires reducing the cost as much as possible. Which of the following solutions will best satisfy this requirement?

- **A. Creating Spot VMs in one availability zone**
- B. Using ephemeral storage on replicated VMs
- C. Using provisioned IOPS storage
- D. Spreading the VMs across different regions

Answer: A

Explanation:

Using Spot VMs is a cost-effective solution as these are available at significantly reduced prices compared to standard instances. Spot VMs are ideal for workloads that can tolerate interruptions and are a way to take advantage of unused cloud capacity.

NEW QUESTION # 201

A software engineer at a cybersecurity company wants to access the cloud environment. Per company policy, the cloud environment should not be directly accessible via the internet. Which of the following options best describes how the software engineer can access the cloud resources?

- A. SSH
- B. Bastion host
- C. Web portal
- D. Token-based access

Answer: B

Explanation:

A bastion host is the best option described for accessing cloud resources without direct internet access. It acts as a secure gateway to access internal networks from external sources and is often used in conjunction with other security measures such as SSH for secure connections. References: The use of bastion hosts as a secure access point to cloud resources is a security best practice covered in the CompTIA Cloud+ certification's domain on cloud security.

NEW QUESTION # 202

A cloud administrator needs to collect process-level, memory-usage tracking for the virtual machines that are part of an autoscaling group. Which of the following is the best way to accomplish the goal by using cloud-native monitoring services?

- A. Deploying the cloud-monitoring agent software
- B. Scheduling a script to collect the data
- C. Configuring page file/swap metrics
- D. Enabling memory monitoring in the VM configuration

Answer: A

Explanation:

To collect process-level, memory-usage tracking for virtual machines, deploying cloud-monitoring agent software is the best approach. The agent can gather detailed system metrics and send them to the cloud-native monitoring services for analysis and visualization.

NEW QUESTION # 203

An organization is hosting a seminar with eight individuals who need to connect to their own dedicated VM. The technician used the following VM configurations:

IP address: DHCP

NIC: 1Gbps

Network: 10.1.10.0/29

Several users are unable to access their VMs. Which of the following best describes the reason?

- A. Not enough addresses are available.
- B. The routes are misconfigured.
- C. DHCP is not working correctly on the VM.
- D. Too much traffic is on the network.

Answer: A

Explanation:

The network is configured with a subnet of /29, which provides only 6 usable IP addresses after accounting for the network and broadcast addresses. With eight individuals needing to connect to their own dedicated VMs, there are not enough IP addresses available to assign to each VM, leading to several users being unable to access their VMs. This issue is not related to misconfigured routes, network traffic, or DHCP functionality, but rather the limited number of IP addresses available in the given subnet.

NEW QUESTION # 204

A systems administrator needs to configure a script that will monitor whether an application is healthy and stop the VM if an unsuccessful code is returned. Which of the following scripts should the systems administrator use to achieve this goal?

- A. else{
echo
string APP_URL
int RESPONSE_CODE
string VM
health_checker (APP_URL, VM) {
if[http_probe (APP_URL) == 200] {
echo RESPONSE_CODE }
stop (VM)
RESPONSE_CODE }
}
- B. RESPONSE_CODE }
string APP_URL
bool RESPONSE_CODE
string VM
health_checker (APP_URL, VM) {
if[http_probe (APP_URL) == 200] {
echo RESPONSE_CODE }
else{
stop (VM)
echo
}
- C. else{
echo
string APP_URL
float RESPONSE_CODE
string VM
health_checker (APP_URL, VM) {
if[http_probe (APP_URL) == 200] {
stop (RESPONSE_CODE)
echo VM }
stop (VM)
RESPONSE_CODE }
}
- D. else{
echo
string APP_URL
int RESPONSE_CODE
string VM
health_checker (APP_URL, VM) {
if[http_probe (VM) == 200] {
stop (VM)
echo RESPONSE_CODE }
RESPONSE_CODE }
}

Answer: B

Explanation:

Script A is designed to monitor the health of an application by checking its response code. If the application returns a 200 (OK) status, it indicates that the application is healthy. Otherwise, the script will stop the VM to address the issue, which is a common approach to handle unhealthy application states in automated environments. This script effectively achieves the goal of monitoring application health and taking corrective action when an unsuccessful code is returned.
