EMC Dell Technologies PowerMax Operate Sample Questions (Q60-Q65):

NEW QUESTION # 60

Which product(s) support(s) only 7+1 in RAID 5 configurations?

- A. VMAX All Flash
- B. VMAX All Flash and PowerMax 8000
- C. VMAX3
- D. VMAX All Flash and PowerMax 2000

Answer: B

NEW QUESTION # 61

What takes place during an SRDF Restore operation?

- A. Enables access to both the R1 and R2 devices for their hosts
- B. Changes made to the R2 are propagated to the R1. Changes made to the R1 are discarded
- C. Resumes normal SRDF mirroring and host access
- D. Changes made to the R1 are propagated to the R2. Changes made to the R2 are discarded

Answer: D

Explanation:

Step by Step Comprehensive Detailed Explanation:

In SRDF (Symmetrix Remote Data Facility), a "Restore" operation is used to resynchronize the source (R1) and target (R2) devices after a situation where the target device might have been modified independently.

This typically occurs after a failover scenario where the target device becomes the primary and undergoes changes.

During an SRDF Restore operation:

* R2 Changes Discarded: Any changes made to the target (R2) device since the last synchronization are discarded.

* R1 Changes Propagated: The current data on the source (R1) device is copied over to the target (R2), overwriting any existing data on the target.

This effectively restores the target device to a state consistent with the source device, ensuring data integrity and consistency.

Why other options are incorrect:

* B. Resumes normal SRDF mirroring and host access: While a Restore operation can be part of the failback process, it's not the only step involved. Failback might involve additional actions like reversing replication direction and restoring host access.

* C. Changes made to the R2 are propagated to the R1. Changes made to the R1 are discarded: This describes an "Update" operation, not a "Restore."

* D. Enables access to both the R1 and R2 devices for their hosts: This describes a "Split" operation, where both devices are made accessible independently.

NEW QUESTION # 62

Where is the automatic backup feature for the Solutions Enabler Group Name Services database set?

- A. SYMAPI options file
- **B. SYMAPI variable**
- C. SYMCLI environment variable
- D. Daemon options file

Answer: B

NEW QUESTION # 63

A systems administrator plans to use Non-Disruptive Migration (NDM) to migrate data (from a VMAX array running Enginuity 5876 to a PowerMax running PowerMaxOS 5978). Which NDM mode is used?

- A. Metro-based
- B. Pass-through
- **C. Adaptive Copy**
- D. Asynchronous

Answer: C

Explanation:

Step by Step Comprehensive Detailed Explanation:

Non-Disruptive Migration (NDM) in PowerMax offers different modes for migrating data between storage arrays. When migrating from a VMAX array running Enginuity 5876 to a PowerMax running PowerMaxOS 5978, the Adaptive Copy mode is used.

Adaptive Copy mode is designed for migrations between different storage array platforms or microcode versions. It provides flexibility and efficiency by dynamically adjusting the migration process based on the source and target array capabilities.

Why other options are incorrect:

* A. Asynchronous: This mode is typically used for SRDF replication, not NDM.

* C. Pass-through: This mode is not relevant to NDM.

* D. Metro-based: This mode is used for specific metro distance configurations in SRDF.

* Dell Solutions Enabler 10.0.0 CLI User Guide: This guide may provide further details about NDM commands and options, including how to specify the migration mode.

Which Threshold levels must be set when creating customized threshold alerts in Unisphere for PowerMax?

- A. Warning, Marginal, and Critical
- B. Stable, Critical, and Fatal
- C. Warning, Critical, and Fatal
- D. Stable, Marginal, and Critical
