Exam UiPath-SAIv1 Labs & UiPath-SAIv1 Exam Guide Materials

We respect different propensity of exam candidates, so there are totally three versions of UiPath-SAIv1 guide dumps for your reference. The PDF version of UiPath-SAIv1 practice materials helps you read content easier at your process of studying with clear arrangement and the PC Test Engine version of UiPath-SAIv1 real test allows you to take simulative exam. Besides, the APP version of our practice materials, you can learn anywhere at any time with UiPath-SAIv1 study guide by your electronic devices.

UiPath Certified Professional Specialized AI Professional v1.0 Sample Questions (Q162-Q167):

NEW QUESTION # 162

What action should be performed to have the Taxonomy Manager button appear on the Ribbon, in the Wizard section?

- A. Nothing to do, it should be already there.
- B. Install a newer version of Studio.
- **C. Install UiPath.IntelligentOCR.Activities package.**
- D. Install UiPath.DocumentUnderstanding.ML.Activities package.

Answer: C

Explanation:

To enable the Taxonomy Manager button in the Ribbon, the UiPath.IntelligentOCR.Activities package must be installed. This package includes all activities related to Document Understanding, including the Taxonomy Manager.

NEW QUESTION # 163

For what type of documents is it recommended to use the Form Extractor?

- A. For structured or semi-structured documents where the extraction method is based on a set of FlexiCapture definition files.
- B. For structured or semi-structured documents in which layouts of different document providers vary greatly.
- C. For structured or semi-structured documents where for certain fields, data is always found in a strict, predictable format and context.
- **D. For use cases in which non-variable format documents need to be processed.**

Answer: D

Explanation:

The Form Extractor in UiPath is best suited for documents that have a fixed or non-variable format. This means that documents where the layout remains consistent and predictable, such as standardized forms or invoices, are ideal for this extraction method. The Form Extractor uses predefined templates that map data fields based on their positions, making it highly effective for extracting data from documents with little to no variation in layout. It is not well-suited for documents with significant layout variability, which would require a more flexible extraction approach, such as a machine learning extractor.

NEW QUESTION # 164

Which activity can be used to convert the default taxonomy.json file into a variable for further use?

- **A. UiPath.IntelligentOCR.Activities.TaxonomyManagement.LoadTaxonomyFile**
- B. UiPath.IntelligentOCR.Activities.TaxonomyManagement.LoadFile
- C. UiPath.IntelligentOCR.Activities.TaxonomyManagement.LoadFileTaxonomy
- D. UiPath.IntelligentOCR.Activities.TaxonomyManagement.LoadTaxonomy

Answer: A

NEW QUESTION # 165

What is the correct execution order of the Document Understanding template stages?

Instructions: Drag the stages found on the "Left" and drop them on the "Right" in the correct order.

□

Answer:

Explanation:

□ Explanation:

The correct execution order of the Document Understanding template stages is:

- * Taxonomy
- * Digitize
- * Classify
- * Extract
- * Extraction Validation
- * Export

Comprehensive and Detailed Explanation: The Document Understanding template stages are based on a document processing flowchart that follows these steps:

* First, you need to define the Taxonomy of the document types and fields that you want to process and extract information from. This is done using the Taxonomy Manager in UiPath Studio1.

* Next, you need to Digitize the input documents, which can be in various formats such as PDF, image, or text. This is done using the Digitize Document activity, which converts the documents into a machine-readable format and performs OCR if needed2.

* Then, you need to Classify the digitized documents into the predefined document types in your taxonomy. This is done using the Classify Document Scope activity, which can use various classifiers such as Keyword Based Classifier, Machine Learning Classifier, or Intelligent Form Extractor3.

* After that, you need to Extract the relevant information from the classified documents based on the fields in your taxonomy. This is done using the Data Extraction Scope activity, which can use various extractors such as Regex Based Extractor, Machine Learning Extractor, or Form Extractor.

* Next, you need to perform Extraction Validation to review and correct the extracted information, either manually or automatically. This is done using the Present Validation Station activity, which can use either the Validation Station or the Action Center for human-in-the-loop validation.

* Finally, you need to Export the validated information to the desired output location, such as a file, a database, or a queue. This is done using the Export Extraction Results activity, which can use various exporters such as Excel Exporter, CSV Exporter, or Queue Item Exporter.

NEW QUESTION # 166

What information should be filled in when adding an entity label for the OOB (Out Of the Box) labeling template?

- A. Name. Data Type. Attribute name, and Color.
- B. Name, Shortcut, and Color.
- C. Name, Data Type. Attribute name. Shortcut, and Color.
- **D. Name. Input to be labeled. Attribute name. Shortcut, and Color.**

Answer: D

Explanation:

The OOB labeling template is a predefined template that you can use to label your text data for entity recognition models. The template comes with some preset labels and text components, but you can also add your own labels using the General UI or the Advanced Editor. When you add an entity label, you need to fill in the following information:

* Name: the name of the new label. This is how the label will appear in the labeling tool and in the exported data.

* Input to be labeled: the text component that you want to label. You can choose from the existing text components in the template, such as Date, From, To, CC, and Text, or you can add your own text components using the Advanced Editor. The text component determines the scope of the text that can be labeled with the entity label.

* Attribute name: the name of the attribute that you want to extract from the text. You can use this to create attributes such as customer name, city name, telephone number, and so on. You can add more than one attribute for the same label by clicking on + Add new.

* Shortcut: the hotkey that you want to assign to the label. You can use this to label the text faster by using the keyboard. Only single letters or digits are supported.

* Color: the color that you want to assign to the label. You can use this to distinguish the label from the others visually.
