What is the MOST cost-effective approach to satisfy the compliance requirement?

- A. Store the data in Amazon S3 Standard storage with a lifecycle rule to transition the data to Amazon S3 Standard-Infrequent Access (S3 Standard-IA) after 7 days, then transition to the GLACIER storage class after 30 days.
- **B. Store the data in Amazon S3 Standard storage with a lifecycle rule to transition the data to the GLACIER storage class after 7 days.**
- C. Store the data in Amazon S3 Standard storage with a lifecycle rule 10 transition the data to the GLACIER storage class after 30 days.
- D. Store the data in Amazon S3 Standard storage with a lifecycle rule 10 transition the data 10 Amazon S3 Standard-Infrequent Access (S3 Standard-IA) after 7 days.

Answer: B

NEW QUESTION # 579

A client has set up an Auto Scaling group associated with a load balancer. The client has noticed that instances launched by the Auto Scaling group are reported unhealthy as the result of an Elastic Load Balancing (ELB) health check, but these unhealthy instances are not being terminated.

What can a Solutions Architect do to ensure that the instances marked unhealthy will be terminated and replaced?

- A. Change the health check type to ELB for the Auto Scaling group.
- B. Change the health check set on the ELB load balancer to use TCP rather than HTTP checks.
- C. Increase the value for the health check interval set on the ELB load balancer.
- **D. Change the thresholds set on the Auto Scaling group health check.**

NEW QUESTION # 582

A company collects temperature, humidity, and atmospheric pressure data in cities across multiple continents.

The average volume of data collected per site each day is 500 GB. Each site has a high-speed internet connection. The company's weather forecasting applications are based in a single Region and analyze the data daily.

What is the FASTEST way to aggregate data from all of these global sites?

- A. Upload site data to an Amazon S3 bucket in the closest AWS Region. Use S3 cross-Region replication to copy objects to the destination bucket.
- B. Schedule AWS Snowball jobs daily to transfer data to the closest AWS Region. Use S3 cross-Region replication to copy objects to the destination bucket.
- **C. Enable Amazon S3 Transfer Acceleration on the destination bucket. Use multipart uploads to directly upload site data to the destination bucket.**
- D. Upload the data to an Amazon EC2 instance in the closest Region. Store the data in an Amazon Elastic Block Store (Amazon EBS) volume. Once a day take an EBS snapshot and copy it to the centralized Region. Restore the EBS volume in the centralized Region and run an analysis on the data daily.

Answer: C

Explanation:

You might want to use Transfer Acceleration on a bucket for various reasons, including the following:

You have customers that upload to a centralized bucket from all over the world.

You transfer gigabytes to terabytes of data on a regular basis across continents.

You are unable to utilize all of your available bandwidth over the Internet when uploading to Amazon S3.

"Amazon S3 Transfer Acceleration can speed up content transfers to and from Amazon S3 by as much as 50-

500% for long-distance transfer of larger objects. Customers who have either web or mobile applications with widespread users or applications hosted far away from their S3 bucket can experience long and variable upload and download speeds over the Internet"

"Improved throughput - You can upload parts in parallel to improve throughput."
