EMC Dell Midrange Storage Solutions Design 2023 Sample Questions (Q84-

Q89):

NEW QUESTION # 84

A customer has invested much time using the Dell PS Series Host Integration Toolkit (HIT) to integrate SAN snapshot protection with Microsoft SQL Server native snapshot technology. The customer expresses concern about whether Dell EMC SC Series cross-platform replication supports that capability. What should be your response?

- A. Cross-platform replication works with SC Series HIT integrations.
- B. Cross-platform replication works with PS Series HIT integrations.
- C. Leverage the integration investment and use only PS-to-PS replication on those volumes.
- D. Recreate integration on the SC Series array and use only SC-to-SC replication for those volumes.

Answer: A

NEW QUESTION # 85

How are SAS ports used by Dell Unity XT storage processors?

- A. To move data to and from the backend drives.
- B. To provide host connectivity.
- C. To increase processing speed.
- D. To move data between the data array.

Answer: A

Explanation:

In Dell Unity XT storage processors, SAS (Serial Attached SCSI) ports are used to move data to and from the backend drives. SAS ports provide a high-speed and reliable connection between the storage processors and the physical drives, ensuring efficient data transfer and access. This connectivity is crucial for maintaining the performance and scalability of the storage system.

NEW QUESTION # 86

A systems administrator has deployed a Dell Unity XT 380F with 90x 1.92 TB SSDs in a dynamic pool. How many drives are allocated as spare space?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: C

Explanation:

The Dell Unity XT 380F has a default spare space allocation of 4% of the total number of drives in a dynamic pool. So with 90x 1.92 TB SSDs, 4 drives will be allocated as spare space. These spare drives are used to automatically replace a failed drive, ensuring data availability and protection.

NEW QUESTION # 87

Which network option should be configured to provide the best iSCSI performance on a Dell Unity XT array?

- A. Single VLAN for all traffic
- B. Disable flow control
- C. iSCSI offload
- D. Jumbo frames

Answer: D

Explanation:

For optimal iSCSI performance on a Dell Unity XT array, configuring jumbo frames is recommended. Jumbo frames allow for larger packets of data to be sent over the network, reducing the CPU load on both the storage array and the host, and improving overall throughput. Configuring jumbo frames typically involves setting the MTU (Maximum Transmission Unit) to 9000 bytes on all network devices along the path.

NEW QUESTION # 88

The CPU utilization in a Dell Unity XT system is currently at 68%. What is the level of CPU utilization?

- A. Low Utilization
- B. Extremely High Utilization
- C. High Utilization
- D. Normal Utilization

Answer: C

Explanation:

* Understanding CPU Utilization Levels:

* Dell Unity XT systems categorize CPU utilization to help administrators assess the performance and health of their storage systems.

* Utilization levels typically include categories like low, normal, high, and extremely high to simplify performance monitoring.

* CPU Utilization in Dell Unity XT:

* According to Dell Unity XT documentation, CPU utilization percentages are used to determine the performance state of the system.

* A CPU utilization of 68% is considered high but not critical. This is because the system is handling a significant load but still within operational parameters.

* Operational Thresholds:

* Low Utilization: Below 30%

* Normal Utilization: 30% - 60%

* High Utilization: 60% - 80%

* Extremely High Utilization: Above 80%

* Given these thresholds, 68% falls into the "High Utilization" category.

* Dell Midrange Storage References:

* Dell Technologies Partner Program documentation on midrange storage provides detailed metrics and thresholds for system performance. This information is crucial for administrators to make informed decisions about system capacity and performance tuning.

* Additional resources on Dell's community forums and official product pages for entry-level and midrange storage also support these utilization thresholds.

By categorizing CPU utilization as "High" at 68%, administrators can take necessary actions to optimize system performance or plan for additional capacity if needed.
