ISA/IEC 62443 Cybersecurity Fundamentals Specialist Sample Questions (Q189-Q194):

NEW QUESTION # 189

Which standard is applied during the Assess phase for risk assessment?

- A. ISA/IEC 62443-3-2
- B. ISA/IEC 62443-3-3
- C. ISA/IEC 62443-2-1
- D. ISA/IEC 62443-3-1

Answer: A

Explanation:

ISA/IEC 62443-3-2 specifically describes the methodology for conducting risk assessments within industrial automation and control systems (IACS). This part of the standard provides guidance on identifying risks, assigning Security Levels, and making design decisions during the Assess phase of the IACS Cybersecurity Lifecycle.

Reference: ISA/IEC 62443-3-2:2020, Section 4 ("Cybersecurity risk assessment for system design").

NEW QUESTION # 190

Which of the following refers to internal rules that govern how an organization protects critical system resources?

Available Choices (select all choices that are correct)

- A. Security policy
- D- Code of conduct
- B. Formal guidance
- C. Legislation

Answer: A

Explanation:

A security policy refers to internal rules that govern how an organization protects critical system resources, such as industrial control systems (ICS). A security policy defines the objectives, scope, roles, responsibilities, and requirements for securing the ICS environment, as well as the procedures and guidelines for implementing, monitoring, and enforcing the security measures. A security policy also establishes the baseline for assessing and managing the security risks to the ICS, and for ensuring compliance with relevant standards, regulations, and best practices. A security policy is a key component of the ICS security program, and it should be documented, communicated, and reviewed regularly.

The other choices are not correct because:

* A. Formal guidance. Formal guidance refers to external sources of information and recommendations that can help an organization improve its ICS security posture, such as standards, frameworks, guidelines, and best practices. Formal guidance is not an internal rule, but rather a reference that can be used to develop, implement, and evaluate the security policy and controls. For example, the ISA/IEC

62443 series of standards provide formal guidance on how to secure ICS from cyber threats¹.

* B. Legislation. Legislation refers to external laws and regulations that impose legal obligations and penalties on an organization for its ICS security performance, such as the NERC CIP standards for the electric sector², or the EU NIS Directive for critical infrastructure operators³. Legislation is not an internal rule, but rather a compliance requirement that must be met by the organization. Legislation may also influence the security policy and controls, as the organization needs to align its security objectives and practices with the legal expectations and consequences.

* D. Code of conduct. A code of conduct refers to a set of ethical principles and values that guide the behavior and decision-making of an organization and its employees, such as honesty, integrity, respect, and accountability. A code of conduct is not an internal rule for protecting critical system resources, but rather a general norm for conducting business and maintaining a positive reputation. A code of conduct may also support the security policy and culture, as it can foster a sense of responsibility and trust among the ICS stakeholders.

NEW QUESTION # 191

What does IACS stand for?

- A. Industrial Associations and Control Systems
- B. International Automated and Control Systems
- C. Integrated Automation and Control Systems
- **D. Industrial Automation and Control Systems**

Answer: D

Explanation:

IACS stands for "Industrial Automation and Control Systems." The ISA/IEC 62443 series defines IACS as systems used for industrial automation, process control, and related functions. These include systems such as Distributed Control Systems (DCS), SCADA systems, and PLCs. The term encompasses all electronic systems, networks, and equipment used to automate industrial processes.

Reference: ISA/IEC 62443-1-1:2007, Section 3.2.1 (Definitions and Abbreviations); Glossary entry for "IACS."

NEW QUESTION # 192

Which is a reason for
and physical security regulations meeting a mixed resistance?
Available Choices (select all choices that are correct)

- **A. There are a limited number of enforced cybersecurity and physical security regulations.**
- B. Cybersecurity risks can best be managed individually and in isolation.
- C. Regulations contain only informative elements.
- D. Regulations are voluntary documents.

Answer: A

NEW QUESTION # 193

Which is NOT a potential consequence for organizations that fail to prioritize control system security?

- A. Personal injury
- B. Violation of legal and regulatory requirements
- C. Unauthorized access, theft, or misuse of data
- **D. Decreased energy consumption**

Answer: D

Explanation:

Decreased energy consumption is not a consequence of poor control system security. In fact, security breaches often lead to increased (not decreased) energy consumption due to inefficiencies, system downtime, or damage. Real consequences of failing to prioritize control system security include personal injury (due to process hazards), unauthorized data access, theft or misuse, and violation of regulations (with possible legal penalties).

Reference: ISA/IEC 62443-1-1:2007, Section 4.4; ISA/IEC 62443-2-1:2009, Section 4.2.2 (Potential Consequences Table).
