Pass-Sure 100% Free AWS-Certified-Developer-Associate – 100% Free Exam Objectives | AWS-Certified-Developer-Associate Cert

With the quick development of the electronic products, more and more electronic devices are designed to apply to our life. Accordingly there are huge changes on the study models of our AWS-Certified-Developer-Associate exam dumps as well. There are three different versions of our AWS-Certified-Developer-Associate Study Guide designed by our specialists in order to satisfy varied groups of people. They are version of the PDF, the Software and the APP online. All these versions of AWS-Certified-Developer-Associate practice materials are easy and convenient to use.

Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q325-Q330):

NEW QUESTION # 325

A developer is creating an application that includes an Amazon API Gateway REST API in the us-east-2 Region. The developer wants to use Amazon CloudFront and a custom domain name for the API. The developer has acquired an SSL/TLS certificate for the domain from a third-party provider.

How should the developer configure the custom domain for the application?

- A. Import the SSL/TLS certificate into AWS Certificate Manager (ACM) in the us-east-1 Region. Create a DNS CNAME record for the custom domain.
- B. Import the SSL/TLS certificate into CloudFront. Create a DNS CNAME record for the custom domain.
- C. Import the SSL/TLS certificate into AWS Certificate Manager (ACM) in the same Region as the API.

Create a DNS CNAME record for the custom domain.

- D. Import the SSL/TLS certificate into AWS Certificate Manager (ACM) in the same Region as the API.
Create a DNS A record for the custom domain.

Answer: A

Explanation:

Amazon API Gateway is a service that enables developers to create, publish, maintain, monitor, and secure APIs at any scale.

Amazon CloudFront is a content delivery network (CDN) service that can improve the performance and security of web applications. The developer can use CloudFront and a custom domain name for the API Gateway REST API. To do so, the developer needs to import the SSL/TLS certificate into AWS Certificate Manager (ACM) in the us-east-1 Region. This is because CloudFront requires certificates from ACM to be in this Region. The developer also needs to create a DNS CNAME record for the custom domain that points to the CloudFront distribution.

NEW QUESTION # 326

A developer manages a website that distributes its content by using Amazon CloudFront. The website's static artifacts are stored in an Amazon S3 bucket.

The developer deploys some changes and can see the new artifacts in the S3 bucket. However, the changes do not appear on the webpage that the CloudFront distribution delivers.

How should the developer resolve this issue?

- A. Set CloudFront to invalidate the cache after the artifacts have been deployed to Amazon S3.
- B. Configure S3 Object Lock to update to the latest version of the files every time an S3 object is updated.
- C. Configure the S3 bucket to clear all old objects from the bucket before new artifacts are uploaded.
- D. Set CloudFront to modify the distribution origin after the artifacts have been deployed to Amazon S3.

Answer: A

NEW QUESTION # 327

A deployment package uses the AWS CLI to copy files into any S3 bucket in the account, using access keys stored in environment variables. The package is running on EC2 instances, and the instances have been modified to run with an assumed IAM role and a more restrictive policy that allows access to only one bucket. After the change, the Developer logs into the host and still has the ability to write into all of the S3 buckets in that account.

What is the MOST likely cause of this situation?

- A. The AWS CLI is corrupt and needs to be reinstalled
- B. An IAM managed policy is being used on the IAM role
- C. An IAM inline policy is being used on the IAM role
- D. The AWS credential provider looks for instance profile credentials last

Answer: B

NEW QUESTION # 328

A Developer is writing an application in AWS Lambda. To simplify testing and deployments, the Developer needs the database connections string to be easily changed without modifying the Lambda code.

How can this requirement be met?

- A. Store the connection string as a Lambda layer.
- B. Store the connection string as a secret in AWS Secrets Manager.
- C. Store the connection string in AWS KMS.
- D. Store the connection string in an IAM user account.

Answer: C

Explanation:

NEW QUESTION # 329

A company is creating an application that processes csv files from Amazon S3. A developer has created an S3 bucket. The developer has also created an AWS Lambda function to process the csv files from the S3 bucket. Which combination of steps will invoke the Lambda function when a csv file is uploaded to Amazon S3?

(Select TWO.)

- A. Add S3 Lifecycle rules to invoke the existing Lambda function
- B. Create an Amazon EventBridge rule. Configure the rule with a pattern to match the S3 object created event
- C. Add a trigger to the existing Lambda function. Set the trigger type to EventBridge. Select the Amazon EventBridge rule.
- D. Create a new Lambda function to scan the S3 bucket for recently added S3 objects
- E. Schedule an Amazon EventBridge rule to run a new Lambda function to scan the S3 bucket.

Answer: A,B

Explanation:

* Amazon EventBridge: A service that reacts to events from various AWS sources, including S3. Rules define which events trigger actions (like invoking Lambda functions).

* S3 Object Created Events: EventBridge can detect these, providing seamless integration for automated CSV processing.

* S3 Lifecycle Rules: Allow for actions based on object age or prefixes. These can directly trigger Lambda functions for file processing.
