

Latest Test SailPoint IdentityIQ-Associate Discount - IdentityIQ-Associate Exam Guide Materials

Once our professionals find the relevant knowledge on the IdentityIQ-Associate exam questions, then the whole research groups will pick out the knowledge points according to the test syllabus. Also, they will also compile some questions about the IdentityIQ-Associate practice materials in terms of their experience. Now, we have successfully summarized all knowledge points in line with the IdentityIQ-Associate outline. And meanwhile, we keep a close eye on the changes of the exam to make sure what you buy are the latest and valid.

SailPoint IdentityIQ-Associate Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> Identity Modeling: Explains how identity data is structured and managed through IdentityCubes, identity attributes, groups, populations, and manager correlation.
Topic 2	<ul style="list-style-type: none"> Foundational Concepts: Covers the core purpose of identity security, key IdentityIQ terminology, system components, and how rules, tasks, workflows, and business modeling fit into the platform.
Topic 3	<ul style="list-style-type: none"> Provisioning: Covers how IdentityIQ provisions access, including triggering actions, provisioning policies, Lifecycle Events, and attribute synchronization.
Topic 4	<ul style="list-style-type: none"> User-Driven Requests: Explains how users submit access requests, what request types are available, and how QuickLink Populations control who can request what for whom.
Topic 5	<ul style="list-style-type: none"> Access Modeling: Covers how entitlements and roles are defined, cataloged, and assigned to identities within IdentityIQ.
Topic 6	<ul style="list-style-type: none"> Governance: Addresses how access certifications are conducted and how policy violations are defined and detected across the organization.

IdentityIQ-Associate Exam Guide Materials - IdentityIQ-Associate Customized Lab Simulation

Our research materials will provide three different versions of IdentityIQ-Associate valid practice questions, the PDF version, the software version and the online version. Software version of the features are very practical, I think you can try to use our IdentityIQ-Associate test prep software version. I believe you have a different sensory experience for this version of the product. Because the software version of the IdentityIQ-Associate Study Guide can simulate the real test environment, users can realize the effect of the atmosphere of the IdentityIQ-Associate exam at home through the software version.

SailPoint Certified IdentityIQ Associate Exam Sample Questions (Q14-Q19):

NEW QUESTION # 14

Is this displayed in the Identity Warehouse?

Entitlements (identity's permissions on native applications)

- A. Yes
- B. No

Answer: A

Explanation:

Yes. In SailPoint IdentityIQ, the Identity Warehouse presents identity-centered information collected and modeled inside the IdentityCube. Entitlements are part of that identity view because they represent the user's permissions or access rights on connected applications. During aggregation, IdentityIQ reads account data from applications, including entitlement-bearing attributes such as groups, roles, permissions, or other managed access values. These are stored on the identity's application accounts and surfaced in the Identity Warehouse so reviewers, administrators, and governance users can understand what access the identity currently has. This is distinct from identity attributes such as department, manager, location, or lifecycle state. Entitlements describe access on target systems and are central to access reviews, policy evaluation, role modeling, and access request decisions. Displaying entitlements in the Identity Warehouse allows IdentityIQ to provide a complete access profile for the identity, including accounts, assigned roles, detected roles, policy violations, and application permissions.

Therefore, entitlements are displayed as part of the Identity Warehouse identity details. Reference topics: Identity Modeling, IdentityCube contents, Identity Warehouse, application accounts, entitlement aggregation, managed attributes, and access visibility.

NEW QUESTION # 15

Is this statement true about attributes in IdentityIQ?

Account attributes are defined in the application account schema.

- A. Yes
- B. No

Answer: A

Explanation:

The statement is true. In SailPoint IdentityIQ, account attributes are defined on the application's account schema. The application definition tells IdentityIQ how to represent accounts from a connected source, and the account schema specifies which attributes exist on those accounts. Examples may include account ID, display name, email, status, department, groups, roles, permissions, or other source-specific fields returned by the connector during aggregation.

This is distinct from identity attributes, which are stored on the IdentityCube and represent normalized identity-level data used across IdentityIQ. Account attributes belong to application account links, while identity attributes belong to the identity model. During aggregation, IdentityIQ reads account data according to the application schema and stores the discovered values as account/link attributes. Some account schema attributes may also be marked as managed when their values represent entitlement-like access that should be governed through the Entitlement Catalog.

Therefore, account attributes are correctly defined in the application account schema. Reference topics: Applications - application definitions, account schema attributes, schema attribute properties; Identity Modeling - identity attributes versus account attributes; Access Modeling - managed attributes and entitlement catalog.

NEW QUESTION # 16

Is this statement true about Rapid Setup?

It will create the application definitions.

- A. Yes
- B. No

Answer: A

Explanation:

Yes. Rapid Setup in SailPoint IdentityIQ is designed to accelerate application onboarding by creating and configuring the application definitions required for IdentityIQ to manage data from connected systems. An application definition is the IdentityIQ object that represents an external source or target system and stores the connector selection, connectivity settings, schema information, aggregation behavior, correlation configuration, and related governance options.

Rapid Setup reduces the amount of manual configuration normally required when defining applications.

Instead of building every application definition entirely through the standard detailed configuration screens, Rapid Setup guides the administrator through a simplified setup path and creates the required IdentityIQ application objects from that configuration. Those application definitions can then be used for aggregation, correlation, entitlement discovery, access modeling, and downstream governance processes.

This does not mean Rapid Setup eliminates the need for validation. Administrators must still verify schemas, correlation rules, entitlement treatment, and provisioning behavior. However, the statement is accurate because creating application definitions is a core function of Rapid Setup.

Reference topics: Applications, Rapid Setup, application definitions, connector configuration, schema configuration, aggregation, correlation, and entitlement discovery.

NEW QUESTION # 17

Is this statement about uncorrelated accounts true?

If an application 's correlation logic has changed, the aggregation task can change account correlations to match the new logic.

- A. Yes
- B. No

Answer: A

Explanation:

The statement is true. In SailPoint IdentityIQ, account correlation is the process used to associate an application account, represented as a Link, with the appropriate IdentityCube. Correlation logic is configured on the application and may use account attributes, identity attributes, or correlation rules to determine ownership. When that logic is changed, a subsequent account aggregation can evaluate account data against the updated correlation configuration and adjust account-to-identity associations where the aggregation process is configured to perform correlation.

This is important when accounts were previously uncorrelated, incorrectly correlated, or correlated under outdated matching criteria. For example, if an application originally correlated accounts by user name but is later changed to correlate by employee ID, aggregation can apply the new logic so that accounts align with the correct identities. Manual correlation is therefore not the only remediation path; proper correlation configuration followed by aggregation is a standard way to resolve or correct account ownership.

The behavior depends on the aggregation and correlation configuration, but the principle is accurate:

aggregation can apply changed correlation logic to account correlations. Reference topics: Applications, correlation options, account aggregation, uncorrelated account resolution, Link-to-IdentityCube association, and Identity Modeling.

NEW QUESTION # 18

Is this an accurate statement about preventive policy checking in IdentityIQ?

Preventive policy checking can only stop self-service requests.

- A. Yes
- B. No

Answer: B

Explanation:

The statement is false. Preventive policy checking in SailPoint IdentityIQ is not limited only to self-service requests. Preventive policy evaluation is used to identify policy violations before access changes are completed. This can occur during access request processing, provisioning-related activity, or other configured request paths where IdentityIQ evaluates proposed changes against defined policies before allowing the transaction to proceed.

A self-service request is only one possible entry point. IdentityIQ access requests may be submitted by an end user, a manager, an administrator, or another authorized requester depending on QuickLink Population rules, request configuration, and access-request permissions. Preventive policy checking evaluates the requested access change itself, not merely the fact that the request was self-

initiated. If the proposed access would violate a separation-of-duty, risk, or other governance policy, IdentityIQ can warn, require additional handling, or block the request depending on policy and workflow configuration.

Therefore, the word "only" makes the statement incorrect. Preventive policy checking is a governance control applied to configured access-change activity, not exclusively to self-service actions. Reference topics:

Governance, policy detection, preventive policy checking, access request policy evaluation, User-Driven Requests, and provisioning request control.

NEW QUESTION # 19

.....

All these three SailPoint IdentityIQ-Associate exam questions formats contain the real, valid, and error-free SailPoint Certified IdentityIQ Associate Exam (IdentityIQ-Associate) exam practice test questions that are ideal study material for quick SailPoint IdentityIQ-Associate Exam Preparation. Just choose the right BraindumpsVCE SailPoint Certified IdentityIQ Associate Exam Questions formats and download quickly and start SailPoint Certified IdentityIQ Associate Exam (IdentityIQ-Associate) exam preparation without wasting further time.
